Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfilment of the requirement for the degree of Master of Science

**RELATIONSHIP BETWEEN RUNOFF COEFFICIENT AND
CURVE NUMBER FOR SUNGAI WENG
AND SUNGAI KAYU ARA CATCHMENTS**

By

ASNOR MUIZAN BIN DATO' HJ. ISHAK

March 2006

Chairman : Associate Professor Abdul Halim bin Ghazali, PhD

Faculty : Engineering

Traditionally, the rational formula that embodies runoff coefficient in the equation has widely been used for drainage design due to its simplicity. Two widely used design manuals that are particularly related to the rational formula in Malaysia are the Hydrological Procedure No. 16 (HP16) - Flood Estimation for Urban Areas in Peninsular Malaysia and Hydrological Procedure No. 5 (HP5) - Rational Method of Flood Estimation for Rural Catchments in Peninsular Malaysia. The latter presents the runoff coefficient that have been derived using the statistical approach rather than the deterministic, however, the former shows the look-up table of runoff coefficients that are adopted from few previous efforts that were carried out by some local authorities. The HP16 however has been superceded by the Urban Stormwater Management Manual (MSMA) in 2001, but the runoff coefficients proposed in the manual have been directly adopted from Australian practice.

This study attempts primarily to derive runoff coefficient and runoff curve number in two small catchments [1] urban catchment of Sungai Kayu Ara (more than 48.81% urbanized), and [2] forest catchment of Sungai Weng by using the deterministic approach. The other popular method that is widely used in hydrology is the Soil Conservation Services (SCS)

method, which uses runoff curve number (CN), which has several advantages against the rational method partly because of its flexibility in generating flood hydrograph. In this study, the primary objective was to formulate the relationship between the runoff coefficient (C) and runoff curve number (CN) such that the coefficients can be easily determined for catchments of similar characteristics.

The results show that the runoff coefficient and runoff curve number from the forest catchment were in the range of 0.05 to 0.30 and 44 to 64 respectively; for the urban catchment it was found to be in the range of 0.30 to 0.65 and 64 to 97. The average C for the forest and urban catchments were 0.13 and 0.55 respectively; while the average CN were about 52 and 83 respectively. There was no linear relationship between the two coefficients; however the relationship has been established using logarithmic fit which results in the correlation coefficient, $r= 0.54$ and 0.78 for the forest and urban catchment respectively. Runoff coefficients calculated using the relationship proposed by Chen have been compared with the values obtained in this study. The results show a good agreement for the forest catchment but a slightly poorer agreement in the urban catchment. The SCS initial abstraction factor (K) and peaking factor (F) are also determined in this study.

Abstrak tesis dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Master Sains

**HUBUNGAN DI ANTARA PEKALI ALIRAN DENGAN NOMBOR
LENGKUNG BAGI KAWASAN TADAHAN SUNGAI WENG
DAN SUNGAI KAYU ARA**

Pengerusi : Profesor Madya Abdul Halim bin Ghazali, PhD

Fakulti : Kejuruteraan

Secara tradisi, persamaan mudah formula rational dapat menghasilkan pekali air larian (C) yang telah diguna pakai secara meluas di dalam pengiraan merekabentuk sistem pengairan. Terdapat dua manual rekabentuk yang berkaitan dengan formula rational di Malaysia iaitu Prosedur Hidrologi No. 16 (HP 16) – Pengiraan Banjir untuk Kawasan Bandaran di Semenanjung Malaysia dan Prosedur Hidrologi No. 5 (HP 5) – Formula Rational bagi Pengiraan Banjir untuk kawasan tadahan pendalaman di Semenanjung Malaysia. Kemudian penghasilan pekali air larian akan didemotrasikan dengan menggunakan kaedah statistik selain dari menentukannya, walau bagaimanapun ia akan ditunjukkan di dalam jadual kajian ini bagi pekali air larian di mana ia telah diterima pakai oleh beberapa pihak berkuasa tempatan sebelum ini. Walau bagaimanapun, HP 16 telah diolah bersama dengan Manual Saliran Mesra Alam (MSMA) pada tahun 2001 tetapi pekalnya telah diperolehi secara terus daripada hujan di Australia.

Percubaan awal kajian ini adalah untuk menghasilkan pekali air larian dan nombor lengkung air larian (CN) di dua kawasan tadahan kecil iaitu [1] kawasan tadahan bandaran di Sungai Kayu Ara (lebih kurang 48.81% kawasan bandar) dan [2] kawasan tadahan hutan di Sungai Weng dengan menggunakan pengenalanpastian selain menggunakan kaedah statistik seperti yang telah digunakan di dalam HP 5 sebelum ini. Selain kaedah rasional satu prosedur mudah telah dihasilkan iaitu *Soil Conservation Service* (SCS), nombor lengkung air larian (CN) di mana ia telah dikenal pasti kelebihanannya berbanding dengan persamaan-persamaan lain di mana ia lebih fleksibel dalam menghasilkan hidrograf banjir. Namun begitu objektif utama kajian ini adalah untuk menghasilkan hubungan antara pekali air larian (C) dan nombor lengkung air larian (CN) dalam bentuk formula matematik; akhirnya pekali tersebut boleh ditukar ganti atau diguna pakai di dalam kawasan tadahan yang mempunyai kriteria yang sama.

Keputusan kajian ini menunjukkan pekali air larian dan nombor lengkung air larian di kawasan tadahan hutan adalah dalam lingkungan 0.05 hingga 0.30 dan 44 hingga 64; namun begitu bagi kawasan tadahan bandaran pula di dalam lingkungan 0.30 hingga 0.65 dan 64 hingga 97. Secara umumnya dalam kajian ini memperolehi purata C di kawasan tadahan hutan dan bandaran ialah 0.13 dan 0.55, manakala purata CN telah dikira nilainya antara 52 dan 83. Tiada hubungan secara linear terbentuk untuk dua pekali ini, walau bagaimanapun hubungannya telah berjaya dikaitkan dengan menggunakan persamaan fit logaritma di mana keputusan hubungkait pekali, $r = 0.59$ dan 0.78 untuk kawasan tadahan hutan dan bandaran. Hubungan pekali air larian dan nombor lengkung air larian dari kajian Chen's telah diguna pakai di dalamn kajian ini bagi mengesahkan keputusan yang diperolehi; dimana

perbezaannya menunjukkan satu keputusan yang baik di kawasan tadahan hutan tetapi agak kurang baik sedikit di kawasan tadahan bandaran. Ditentukan juga di dalam kajian ini parameter-parameter di dalam formula SCS seperti faktor pemisahan awal (K) dan faktor puncak (F)

ACKNOWLEDGEMENTS

I would like to pay the most humble gratitude to Allah s.w.t for blessing me with good health and spirit to complete this work. I cordially acknowledge the dynamic support of my chair supervisor, Associate Professor Dr. Abdul Halim bin Ghazali, and co-supervisors, Associate Professor Dr. Thamer Ahmed Mohammed and Ir. Mohd Zaki bin Mat Amin,. I thank them for their suggestions and guidance throughout the course of my research. I would like to extend my appreciation to the staff of Hydrology and Water Resources, Department of Irrigation and Drainage Malaysia (DID) in Ampang, Kuala Lumpur and also DID in Kedah for their assistance, unconditional backing and support which have me to complete my research. I am also grateful to Ir. Hj. Azmi bin Md. Jafri and Ir. Low Koon Sing for their support and encouragement. Lastly, I would like to thank to my dearest mother and father, wife, son, brothers and sisters for their love, patience and understanding.

I certify that an Examination Committee has met on 2nd March 2006 to conduct the final examination of Asnor Muizan bin Dato' Hj. Ishak on his Master of Science thesis entitled "Relationship between Runoff Coefficient and Curve Number for Sungai Weng and Sungai Kayu Ara Catchments" in accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1980 and Universiti Pertanian Malaysia (Higher Degree) Regulations 1981. The Committee recommends that the candidate be awarded the relevant degree. Members of the Examination Committee are as follows:

Ir. MOHD AMIN MOHD SOOM, PhD

Professor
Faculty of Engineering
Universiti Putra Malaysia
(Chairman)

Ir. LEE TEANG SHUI, PhD

Associate Professor
Faculty of Engineering
Universiti Putra Malaysia
(Internal Examiner)

WAN NOR AZMIN SULAIMAN, PhD

Associate Professor
Deputy Dean (Research)
Faculty of Environmental Studies
Universiti Putra Malaysia
(Internal Examiner)

OTHMAN A. KARIM, PhD

Associate Professor
Department of Civil Engineering and Structure
Universiti Kebangsaan Malaysia
(External Examiner)

HASANAH MOHD. GHAZALI, PhD

Professor/Deputy Dean
School of Graduate Studies
Universiti Putra Malaysia

Date :

This thesis submitted to the Senate of Universiti Putra Malaysia has been accepted as fulfillment of the requirements for the degree of Master Science. The members of the Supervisory Committee are as follows:

ABDUL HALIM GHAZALI, PhD

Associate Professor
Faculty of Engineering
Universiti Putra Malaysia
(Chairman)

THAMER AHMED MOHAMMED, PhD

Associate Professor
Faculty of Engineering
Universiti Putra Malaysia
(Member)

Ir. MOHD ZAKI MAT AMIN, MSc

Senior Reseacher
Water Resources Management Division
National Hydraulic Research Institute of Malaysia
(Member)

AINI IDERIS, PhD
Professor/Dean
School of Graduate Studies
Universiti Putra Malaysia

Date :

DECLARATION

I hereby declare that the thesis is based on my original work except for quotations and citations which have been duly acknowledged. I also declare that it has not been previously or concurrently submitted for any other degree at UPM or other institutions.

ASNOR MUIZAN BIN DATO' HJ. ISHAK
