I love you all

Abstract of the thesis presented to the Senate of Universiti Putra Malaysia in fulfilment of the requirement for the degree of Doctor of Philosophy

**APPLICATION OF HYDRO-METEOROLOGICAL MODEL AND GIS IN
SHORT RANGE SEVERE FLOOD FORECASTING AND MAPPING**

By

LAWAL BILLA

May 2006

Chairman: Professor Shattri Bin Mansor, PhD

Faculty: Engineering

Floods resulting from severe seasonal monsoon rainfall are the most important significant natural disaster affecting Malaysia in terms of their impact on the economic, damage to property and sometimes-tragic losses of lives. One of the greatest deficiencies of the current flood models used in the country is the inability to provide cloud and mesoscale rainfall information in the earliest portion of 0-6h of their forecasting period. In this study NOAA- AVHRR and GMS satellite data were processed for grid based rainfall and rainfall intensity mapping to improve short-range quantitative precipitation forecasting (QPF) of severe monsoon weather and also to facilitate the assimilation of QPF into operational flood forecasting.

A 1D cloud model based QPF modeling process was developed, that relates cloud top temperature below 235°K, reflectance above 28% and cloud heights above 12000m with tropical rainfall formation within the range of 3-12 mm/hr. A grid based rainfall intensity map was thus produced for Langat River Basin. High correlations of R^2 above 0.75 were observed for cloud top temperature processed

from GOES data and recorded rainfall of severe monsoon weather of selected stations in Terengganu, Kuantan and Kota Bahru.

Hydrodynamic and rainfall-runoff simulation were performed using MIKE 11 hydrological model and a suitably auto-calibrated NAM runoff model. The hydrological model was tested for rainfall runoff process using observed hourly rainfall data for the flood event of 27 Sept. to 8 Oct. 2000 as well as rainfall estimation derive from the cloud model QPF using hourly GMS temperature reading for the same storm period. The rainfall- runoff hydrographs generated for the two rainfall sources showed similarities with R^2 of 0.9028.

The results of the runoff modeling were integrated in MIKE11 GIS model for flood inundation mapping. Separate inundation maps were generated for the observed rainfall and the QPF derive rainfall runoff results for comparison. The accuracies of both maps were verified using grid point location data for flooded areas published in the DID Annual Flood Report. The verification results showed an accuracy of 70% for both flood maps.

The methods and processes developed by this study are flexible enough to be applied in other mesoscale and severe storm forecasting particularly a tropical setting. In using NOAA satellite, AVHRR data can be received and processed in advance of 6h of the actual rainfall event. This study should thus prove very useful for the assimilation of grid based rainfall intensity into and improve short- range operational flood forecast.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Doktor Falsafah

**APLIKASI MODEL HIDRO-METEOROLOGIKAL DAN GIS DALAM
PEMETAAN DAN RAMALAN JANGKA PENDEK BANJIR BESAR**

Oleh

LAWAL BILLA

Mei 2006

Pengerusi: Profesor Shattri bin Mansor, PhD

Fakulti: Kejuruteraan

Banjir yang berasal daripada hujan lebat monson bermusim merupakan bencana alam yang sangat penting dan signifikan terhadap Malaysia dari segi kesan ekonomi, kerosakan harta benda dan kehilangan nyawa. Di antara kekurangan model-model banjir yang sedia ada adalah ketidakupayaan menyediakan data awan dan hujan berskala meso enam jam sebelum banjir berlaku. Di dalam kajian ini data satelit NOAA-AVHRR diproses untuk menghasilkan grid lokasi hujan serta intensiti hujan untuk meningkatkan ramalan presipitasi kuantitatif (QPF) bagi cuaca monson dalam jangkamasa pendek dan juga untuk memudahkan memasukkan QPF dalam ramalan banjir secara operasional.

Pemodelan proses QPF berasaskan model awan 1D dibangunkan dan berhubungkait terhadap suhu atas awan ($< 235^{\circ}\text{K}$), pembalikan awan ($> 28\%$) dan ketinggian awan ($< 12000\text{m}$) dengan hujan tropika di antara 3-12mm/hr. Kemudian peta intensiti hujan kawasan kajian – lembangan Sungai Langat telah dihasilkan. Korelasi R^2 yang tinggi melebihi 0.75 didapati daripada suhu atas awan daripada data GOES yang telah

diproses dan hujan bagi cuaca monson yang direkod di stesen Terengganu, Kuantan dan Kota Bharu.

Simulasi hidrodinamik dan aliran permukaan-hujan dilaksanakan dengan menggunakan model MIKE 11 dan model auto-kalibrasi NAM. Model hidrologikal ini diuji menggunakan data cerapan hujan setiap jam bagi tempoh banjir dari 27 September hingga 8 Oktober 2000. Anggaran hujan sekali lagi dikomputkan berasaskan kepada QPF daripada bacaan suhu data GMS setiap jam dan digunakan untuk simulasi banjir yang melanda. Hidrograf aliran permukaan hujan yang terjana untuk dua sumber hujan menunjukkan kesamaan dengan $R^2 - 0.9028$.

Model aliran permukaan yang dihasilkan daripada kedua-dua sumber hujan seterusnya digunakan untuk menghasilkan peta banjir dan diintegrasikan ke dalam MIKE11 GIS. Peta banjir yang dijana daripada cerapan hujan dan simulasi hujan QPF dibandingkan. Ketepatan kedua-dua peta disahkan menggunakan data lokasi titik grid bagi kawasan banjir yang diterbitkan di dalam laporan tahunan banjir (JPS). Ketepatan kedua-dua jenis peta banjir yang dicapai adalah 70%.

Kaedah dan proses yang dibangunkan di dalam kajian ini adalah mencukupi untuk diaplikasikan dalam skala meso dan ramalan hujan lebat di dalam kawasan tropika yang lain. Data NOAA-AVHRR boleh diperolehi dan diproses untuk ramalan hujan enam jam sebelum kejadian banjir. Kajian ini membuktikan kepentingan assimilasi grid berasaskan intensiti hujan dan meningkatkan jarak operasi ramalan banjir dengan kadar masa yang lebih panjang.

ACKNOWLEDGEMENTS

My sincere thanks and gratitude goes to the members of the supervisory committee, Prof. Shattri bin Mansor, Assoc. Prof. Ahmad Rodzi Mahmud and Assoc. Prof. Abdul Halim Ghazali for the advice, guidance and support throughout this study. My appreciation and thank also goes to members of research team of the GIS and Geomatic Engineering Unit, include Assoc. Professors. A.R.M. Sheriff, N. Ahmad, R. Mispan and Dr. Helmi and not forgetting Prof. M. Ibrahim, without their valuable advice and encouragement this study wouldn't have reached this fruitful end.

Special thanks are also due to Prof. Kamaruzaman Jusof for his kindness and help. To Mr. T. H. Wong, Mr. K. F. Loh and my study colleagues and Lab mates, your technical advice and friendship has fostered the exchange of knowledge and ideas. Not forgetting my dearest Golnaz Rezai whose friendship I deeply cherish.

To the science and technical officers of SNML and ITMA and not forgetting the faculty of engineering particularly the GIS and Geomatic Engineering Unit, many thanks for the instruction and provision of a good academic and research environment without which this study wouldn't have been possible.

Finally, thanks are due to the Malaysia Meteorological Service (MMS) and Malaysian Drainage and Irrigation Department (DID) for proving the necessary and required meteorological and hydrological data used in the study. And last but not the least to Universiti Putra Malaysia (UPM) for given me the opportunity to further my study in this university.

I certify that and Examination Committee has met on 10 May 2006 to conduct the final examination of Lawal Billa on his Doctor of Philosophy thesis entitled “Application of Hydro-Meteorological Model and GIS in Short Range Severe Flood Forecasting and Mapping” in accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1980 and Universiti Pertanian Malaysia (Higher Degree) Regulations 1981. The Committee recommends that the candidate be awarded the relevant degree. Members of the Examination Committee are as follows:

Mohd. Saleh B. Jaafar, PhD

Associate Professor
Faculty of Engineering
Universiti Putra Malaysia
(Chairman)

Thamer Ahmed Mohamed, PhD

Associate Professor
Faculty of Engineering
Universiti Putra Malaysia
(Internal Examiner)

Helmi Zulhaidi Mohd. Shafri, PhD

Lecturer
Faculty of Engineering
Universiti Putra Malaysia
