**Chairman : Chuah Teong Guan, PhD**

**Faculty : Engineering**

**The influence of small amounts of crude palm oil (CPO) content on the physical and chemical properties of high density polyethylene (HDPE) and linear low-density polyethylene (LLDPE) have been investigated. HDPE and LLDPE containing, 2, 3 and 5% CPO were prepared in a twin-screw extruder. Then, films of 0.2mm thickness were produced by using blown film technique. The melting point of CPO is 35.65°C and melting point of PE is 130-140°C in HDPE and 85-125°C in LLDPE. Thermal observation by Differential Scanning Calorimetry (DSC) is not significant in melting and crystallisation. Similar observation was also presented in storage modulus, tan δ and loss modulus of Dynamic Mechanical Analysis (DMA) results.**

**The improvement of tensile strength and elongation at break showed that the enhancement in toughness of the polymers in the addition of CPO. A gradual increase in impact strength of HDPE with the CPO content further supported above**

**notation. The enhancement in the physical properties in the presence of CPO is believed to be attributed to the increased chain mobility of the polymer along with improved orientation strengthening in HDPE and LLDPE. Evidence from Scanning Electron Micrographs (SEM) were also used to support this contention. However, the decline in impact strength of LLDPE with the addition of CPO is associated with the formation of defects in amorphous phase of LLDPE.**

**With increasing of CPO addition, viscosity is increased at the low shear rate in rheological examination. Melt Flow Index (MFI) value is increased with the incremental of CPO addition. FT-IR analysis shows that almost same spectra of modified PE with control. The results indicate that no chemical reaction occurred between PE and CPO.**

**Abstrak tesis ini dikemukakan kepada Senat Universiti Putra Malaysia sebagaimana memenuhi kerperluan untuk ijazah Master Sains**

**KAJIAN TERHADAP PENGUBAHSUAIAN POLITELINE MENGGUNAKAN  
MINYAK KELAPA SAWIT MENTAH**

**Oleh**

**MIN MIN AUNG**

**April 2006**

**Pengerusi : Chuah Teong Guan, PhD**

**Fakulti : Kejuruteraan**

**Kajian mengenai pengaruh kandungan minyak sawit mentah (CPO) dalam kuantiti yang kecil terhadap keadaan fizikal dan ciri-ciri kimia politeline ketumpatan tinggi (HDPE) dan politeline ketumpatan rendah (LLDPE) telah dijalankan. HDPE dan LLDPE yang mengandungi 2, 3 dan 5 % CPO disediakan di dalam ‘twin-screw extruder’. Kemudian, filem-filem dengan ketebalan 0.2mm dihasilkan dengan melalui teknik pencairan filem. Takat lebur bagi CPO ialah 35.65°C manakala, bagi PE pula ialah 130-140°C di dalam HDPE dan 85-125°C di dalam LLDPE. Pemerhatian dari segi haba pula tidak signifikan untuk peleburan dan pengkristalan. Pemerhatian yang sama turut ditunjukkan dalam modulus simpanan, tan δ dan modulus pengurangan dalam keputusan analisis mekanikal dinamik (DMA). Peningkatan dalam kekuatan regangan dan pemanjangan pada titik penamat dengan penyelarasan penurunan telah meningkatkan tahap**

kekerasan polimer melalui penambahan CPO. Manakala, penurunan secara berperingkat dalam kesan kekuatan HDPE yang mengandungi CPO telah menyokong ‘above notation’. Peningkatan ciri-ciri fizikal dengan kehadiran CPO dipercayai menyumbang kepada peningkatan pergerakan rantaian polimer selaras dengan perkembangan orientasi kekuatan HDPE dan LLDPE. Bukti-bukti daripada pengimbas Mikrograf Elektron juga turut digunakan untuk menyokong pendapat ini. Walau bagaimanapun, penurunan dalam kesan kekuatan LLDPE yang mengandungi CPO adalah sama dengan pembentukan kerosakan dalam fasa amorphous LLDPE.

**Indeks Aliran Lebur (MFI)** berkurangan dengan peningkatan kandungan CPO. Kelikatan yang berkurangan dengan kadar sekata pula menunjukkan tahap kelinciran CPO. Ini membuktikan bahawa kemampuan pemprosesan PE adalah meningkat dengan penambahan CPO. Sifat-sifat rheologikal juga sepadan dengan perubahan morfologi terhadap politeline yang telah dimodifikasi. Aliran ciri-ciri CPO/ PE pula tidak menunjukkan perubahan sebagaimana yang dijangka dengan mengambil kira CPO sebagai agen penyesuaian. Begitu juga keputusan analisis daripada Fourier Transform Infrared (FTIR) yang menunjukkan secara relatifnya interaksi intermolekular yang kuat antara CPO dan PE adalah wujud dalam filem PE termodifikasi.

## **ACKNOWLEDGEMENTS**

**I would like to express my sincere and deep gratitude to my Supervisor Dr.Chuah Teong Guan (UPM) and Dr.Chantara Theyv Ratnam (MINT) who provided considerable invaluable insights and comments to help me enhance the quality to my work. Without their patient support, enlighten guidance, it is impossible for me to complete this long journey. Thanks for All their efforts and precious time for my research.**

**I would like also thanks to members of the supervisory committees, Dr. Suraya Abdul. Rashid (UPM) and Mr.Wan Hasamudin Wan Hassan (MPOB), for their helpful advice and guidance during the course of Research and I wish to thank**

**I would like to thanks to lab supervisor and staff of MINT and PRSS, especially Ms.Normawati Samsudin, Mr.Zulkifli b Ahamid from PRSS and Mr.Wan Ali Wan Yusof, Mr. Zahid Abdullah from MINT.**

**Finally, I dedicate this thesis to my beloved family, in particular, my parents, without their love, support and encouragement, it would not be possible for me.**

**I certify that an Examination Committee has met on 13 April 2006to conduct the final examination of Min Min Aung on her Master of Science entitled “Effect of Crude Palm Oil on the physio-chemical properties of polyethylene blown film” in accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1980 and Universiti Pertanian Malaysia (Higher Degree) Regulations 1981. The Committee recommends that the candidate be awarded the relevant degree. Members of the Examination Committee are as follows:**

**Russly Abdul Rahman, PhD**  
**Professor**  
**Faculty of Food and Science**  
**University Putra Malaysia**  
**(Chairman)**

**Robiah Yunus, PhD**  
**Associate Professor**  
**Faculty of Engineering**
