: Agriculture

The use of agricultural wastes into renewal agricultural products such as fertilizer and growing medium can contribute towards reducing the import bill and safer food as well as avoiding environmental pollution. Two experiments were carried out to assess the effects of five different agriculture waste composts as a nursery media component and source of organic fertilizer for production of cauliflower under protective structure. The five different compost sources used were oil palm empty fruit bunches compost (EFBC), chrysanthemum residue compost (CRC), soybean waste compost (SWC), green waste vermicompost (GWV) and vegetable waste vermicompost (VWV). For cauliflower transplant production, the growth media comprised of a mixture with ratio of 30% compost to 70% sphagnum peat moss (v/v) and 100% of sphagnum peat moss was used as a control. The treatments were laid out in randomized complete block design (RCBD) and replicated four times. Results showed that substitution of peat with compost increased bulk density, available water, porosity and nutrients content of media mixtures. The CRC added media and 100% peat were found to have similar physical characteristics, electrical conductivity (EC) and nutrient content. The highest seedling height, total leaf number, total leaf area, and shoot dry weight were recorded in both CRC mixture and peat media. However, CRC mixture significantly (P<0.05) improved root morphology of cauliflower seedlings compared with those grown in other substrate mixtures. Results showed that peat could be 30% partially substituted by CRC, EFBC, GWV or VWV however the use of SWC can negatively affect plant growth. The physical and chemical properties of SWC added media were found to be unsuitable for seedling growth due to the higher pH, EC and bulk density. This study indicated that composts enhanced seedling growth in several occasions and these growth enhancements could be attributed to the improvement of the physical and chemical properties of the growing media.

Similar compost sources were used as organic fertilizer to assess the effects on the soil properties, nutrient status, growth performance and yield of cauliflower under a protective structure. Composts (EFBC, CRC, SWC, GWV and VWV) as source of fertilizer were applied prior to transplanting and an inorganic fertilizer (N: P₂O₅: K₂O: MgO; 12:12:17:2:TE) was used as a control. The treatments were laid out in randomized complete block design (RCBD) replicated three times. The amount of fertilizer applied was calculated based on 180 kg N ha⁻¹. Results indicated that, the use of composts as organic fertilizer significantly affected soil properties, plant growth, photosynthetic capacity, nutrient status and yield of cauliflower. Application of VWV significantly (P<0.05) affected shoot development of cauliflower planted under protective structure. The growth performance of cauliflower receiving vegetable waste vermicompost (VWV) was similar with those receiving inorganic fertilizer in plant height and plant biomass and greater in total leaf area. The nutritional status of the plants demonstrated that the nutrients were adequate and met the requirements for plant growth and curd development in all fertilizer treatments. Highest curd weight was found with VWV application however, it did not differ significantly with EFBC and inorganically fertilized plants. Both EFBC and VWV applications enhanced the ascorbic acid content. However, curds of VWV could be harvested earlier compared to the other treatments. From the results, composts could produce similar crop growth and yields as inorganic fertilizer when the same amount of N was applied to the plants. However, the effects of compost on plant growth and yield were not always positive and might vary depending on the source of waste, compost maturity and available N of the compost.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Master Sains

KESAN SUMBER KOMPOS BERBEZA SEBAGAI KOMPONEN MEDIA PERTUMBUHAN ANAK BENIH DAN BAJA TERHADAP PRESTASI PERTUMBUHAN KOBIS BUNGA (*Brassica Oleracea* L. Var. Botrytis)

Oleh

Fakulti

: Pertanian

Penggunaan sisa pertanian sebagai produk pertanian seperti baja dan media tanaman boleh menyumbang ke arah mengurangkan bil import, makanan yang lebih selamat dan mengelakkan pencemaran alam sekitar. Kajian telah dijalankan untuk menilai kesan lima kompos sisa pertanian yang berbeza sebagai komponen media semaian dan sebagai sumber baja organik untuk pengeluaran kobis bunga di bawah struktur perlindungan tanaman. Lima kompos dari sumber berbeza yang digunakan adalah kompos tandan buah sawit kosong (EFBC), kompos sisa kekwa (CRC), kompos sisa kacang soya (SWC), vermikompos sisa hijau (GWV) dan vermikompos sisa sayursayuran (VWV). Campuran substrat ini menggunakan nisbah 30% kompos kepada 70% gambut (v/v) dan media 100% gambut digunakan sebagai rawatan kawalan untuk pertumbuhan anak benih. Eksperimen menggunakan rekabentuk rawak lengkap dengan empat replikasi. Hasil kajian menunjukkan bahawa penggantian gambut dengan kompos meningkatkan kepadatan pukal, kesediaan air, keliangan dan kandungan nutrien dalam media campuran. Media yang mengandungi CRC dan media gambut (100%) didapati mempunyai ciri-ciri fizikal, kekonduksian elektrik (EC) dan kandungan nutrien yang serupa. Ketinggian anak benih, jumlah bilangan daun, jumlah luas daun dan berat kering tertinggi direkod dalam media campuran CRC dan media gambut. Walaubagaimanapun, morfologi akar anak benih kobis bunga dalam media campuran CRC dipengaruhi dengan bererti (P < 0.05) berbanding dengan campuran substrat lain. Keputusan mendapati bahawa penggunaan gambut boleh separa digantikan dengan CRC, EFBC, GWV atau VWV manakala penggunaan SWC memberi kesan negatif dan menjejaskan pertumbuhan tanaman. Sifat-sifat fizikal dan kimia media campuran SWC seperti nilai pH, kekonduksian elektrik dan ketumpatan pukal yang tinggi didapati tidak sesuai untuk pertumbuhan anak benih kobis bunga. Kajian ini menunjukkan bahawa kompos menunjukkan peningkatan pertumbuhan anak benih kobis bunga dan peningkatan pertumbuhan ini disumbangkan oleh peningkatan sifat-sifat fizikal dan kimia media tanaman.

Kompos yang sama digunakan sebagai baja organik untuk menilai kesan ke atas sifat tanah, kandungan nutrien, prestasi pertumbuhan dan hasil kobis bunga di bawah struktur perlindungan tanaman. Kompos (EFBC, CRC, SWC, GWV dan VWV) sebagai sumber baja organik diberikan sebelum pemindahan anak benih kobis bunga dan baja bukan organik (N: P₂O₅: K₂O: MgO; 12:12:17:2:TE) digunakan sebagai kawalan, jumlah baja yang digunapakai adalah dikira berdasarkan pada 180 kg ha⁻¹ kandungan N. Eksperimen menggunakan rekabentuk rawak lengkap dengan tiga replikasi. Keputusan menunjukkan penggunaan kompos sebagai baja organik memberi kesan ketara ke atas sifat tanah, pertumbuhan, kapasiti fotosintetik, kandungan nutrien dan hasil kobis bunga. Penggunaan VWV memberi kesan bererti (P < 0.05) terhadap pertumbuhan daun kobis bunga yang ditanam di bawah struktur pelindung tanaman. Prestasi pertumbuhan kobis bunga yang menggunakan vermikompos sisa sayur-sayuran (VWV) adalah sama dengan kobis bunga yang menggunakan baja bukan organik dari segi ketinggian pokok dan berat kering daun dan lebih baik dari segi jumlah luas daun. Kandungan nutrien menunjukkan bahawa nutrien adalah mencukupi dan memenuhi keperluan pertumbuhan dan hasil dalam semua rawatan baja yang diberikan. Hasil kobis bunga tertinggi didapati dengan penggunaan VWV, walaubagaimanapun ia tidak berbeza secara statistik dengan pembajaan EFBC dan bukan organik. Kandungan asid askorbik adalah tertinggi dalam kedua-dua rawatan EFBC dan VWV namun, kobis bunga VWV didapati boleh dituai lebih awal berbanding dengan rawatan lain. Keputusan kajian mendapati penggunaan kompos boleh menghasilkan pertumbuhan dan hasil yang sama seperti baja bukan organik apabila jumlah N yang sama dibekalkan kepada pokok. Walaubagaimanapun, kesan kompos keatas pertumbuhan tanaman dan hasil tidak sentiasa positif dan mungkin berbeza bergantung kepada sumber kompos, tahap kematangan kompos dan tahap ketersediaan N setiap kompos.

ACKNOWLEDGEMENTS

Alhamdulillah, praise to Allah Almighty for giving me strength and courage that finally enable me to accomplish my graduate study. It is of great pleasure to extend my deepest appreciation and sincere thanks to Associate Professor Dr. Siti Aishah Hassan, chairman of my supervisory committee who has contributed so much effort in guiding me through the entire course of this study. Special thanks and appreciation are also extended to the supervisory committee members, Associate Professor Dr. Siti Hajar Ahmad and Mr. Illias Mohd Khir for the invaluable and constructive criticisms and encouragement which made this study a success.

I am also greatly indebted to the Director General of MARDI, Yg Bhg. Datuk Dr. Abd Syukor Abd Rahman for the support and financial assistance during my study. My acknowledgement is also extended to Director of Horticulture Research Centre Yg Mulia Tg Ab Malik Tg Maamun, and Deputy Director of Horticulture Research Centre Dr Hajah Zabedah Mahmood, for their encouragement and support. I would like to extend my sincere thanks to the staffs from the Department of Crop Science and Department of Soil Management of Faculty Of Agriculture, UPM and to Fathkiah Ahmad Marzuki, Mustafa Kamal Abd Ghany, Nor Azwa Salim, Ammini Amrina Saragih and Noraini Md Jaafar who had contributed in one way or another to this work.

I certify that a Thesis Examination Committee has met on 28 August to conduct the final examination of Farahzety Abdul Mutalib on her thesis entitled " Effects Of Compost Sources as a Component of Seedling Growing Media and Fertilizer on Growth Performance of Cauliflower (*Brassica Oleracea* L. Var. Botrytis)" in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The Committee recommends that the student be awarded the Master of Science.

Members of the Thesis Examination Committee were as follows:

Yahya Awang, PhD

Associate Professor Faculty of Agriculture Universiti Putra Malaysia (Chairman)

Mohd Ridzwan Abd Halim, PhD

Associate Professor Faculty of Agriculture Universiti Putra Malaysia (Internal Examiner)

Phebe Ding, PhD

Associate Professor Faculty of Agriculture Universiti Putra Malaysia (Internal Examiner)

Hasnah Md. Jais, PhD

Associate Professor School of Biological Science Universiti Sains Malaysia (External Examiner)

NORITAH OMAR, PhD

Associate Professor and Deputy Dean School of Graduate Studies Universiti Putra Malaysia

Date: 23 October 2014

This thesis was submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfilment of the requirement for the Degree of Master of Science. The members of the Supervisory Committee were as follows:

Siti Aishah Hassan, PhD

Associate Professor Faculty of Agriculture Universiti Putra Malaysia (Chairman)

Siti Hajar Ahmad, PhD Associate Professor Faculty of Agriculture Universiti Putra Malaysia (Member)

Illias Mohd Khir

Senior Research Officer Horticulture Research Centre Malaysian Agricultural Research and Development Institute (MARDI) (Member)

BUJANG BIN KIM HUAT, PhD

Professor and Dean School of Graduate Studies Universiti Putra Malaysia

Date:

Declaration by graduate student

I hereby confirm that:

- this thesis is based on my original work;
- quotations, illustrations and citations have been duly referenced;
- this thesis has not been submitted previously or concurrently for any other degree at any other institutions;
- intellectual property from the thesis and copyright of thesis are fully-owned by Universiti Putra Malaysia, as according to the Universiti Putra Malaysia (Research) Rules 2012;
- written permission must be obtained from supervisor and the office of Deputy Vice-Chancellor (Research and Innovation) before thesis is published (in the form of written, printed or in electronic form) including books, journals, modules, proceedings, popular writings, seminar papers, manuscripts, poster, reports, lecture notes, learning modules or any other materials as stated in the Universiti Putra Malaysia (Research) Rules 2012;
- there is no plagiarism or data falsification/fabrication in the thesis, and scholarly integrity is upheld as according to the Universiti Putra Malaysia (Graduate Studies) Rules 2003 (Revision 2012-2013) and the Universiti Putra Malaysia (Research) Rules 2012. The thesis has undergone plagiarism detection software.

CHAPTER 1

INTRODUCTION

Vegetable industry in Malaysia is highly dependent on imported chemical fertilizers in order to sustain optimum yield production. In 2010, Malaysia imported chemical fertilizers worth RM 4.55 million for agricultural activities including plantation and horticultural crops (Ministry of Agriculture and Agro-based Industry Malaysia, 2011). In 2010, the total vegetable crops occupied 53,057 hectares (Ministry of Agriculture and Agro-based Industry Malaysia, 2011). There is also an increase trend to produce more vegetable crops in order to fulfill the increase population in the country. Malaysia continues to import fresh vegetables mainly from Thailand, Indonesia, Myanmar and Vietnam to meet local consumption as farm labour and production costs are escalating. Since 2008, Malaysia has taken preventive measures and The National Food Security Policy was set out to ensure that food supply is adequate, of quality and safe for consumption. This is due to the increase in food prices and the shortage of food supply at international level that led to food crisis in several countries.

Thus, the use of agricultural wastes as renewable agricultural products such as fertilizer and growing medium can contribute towards reducing the import bill, provide us with safer food and avoid environmental pollution. With continued use, the soil fertility could also improve. The use of organic fertilizers for crops production is more sustainable and is a better management of natural resources than conventional production system. The current interest in reducing the application of chemical fertilizers and increased demand for natural and healthier methods of food production may have a great impact in organic vegetable production. Hence, organic cultivation has become one of the top priorities in our current national agriculture policy. For vegetable cultivation, particularly under protective structure, organic fertilizer is an important alternative to minimize the impact of salt accumulation from intensive and continuous use of chemical fertilization. There have been reports that salt accumulation in soils under plastic houses is a common occurrence (Chang and Liao, 1989; Yoon, 1985). Continuous cropping and repeated use of inorganic fertilizers contributed to the increase in soil acidity, nutrient leaching and reduction of soil physical and organic matter status (Nottidge et al., 2005; Ojeniyi, 2000 and Obi and Ebo, 1995). Thus, an alternative source of maintaining soil fertility has to be sourced and organic fertilizer has been proven as a formidable alternative. Utilization of organic matter has been well documented to improve the physical, chemical and biological properties of soils (Tejada and Gonzalez, 2003; Whalen et al., 2000). Cook et al. (1994) stated that the addition of compost to soil generally improves tilth, structure, infiltration, drainage, and water-holding capacity of soils.

Furthermore, the use of organic wastes as growing media in the production of vegetable seedlings is also important as an alternative to imported commercial growing media and could improve transplant seedling production efficiency. Nursery production of vegetable seedlings is normally practiced to produce seedlings with optimal growth and development. Herrera *et al.* (2008) stated that uniform seedling emergence and rapid growth are essential for efficient crop production. Thus, nutritional quality, structure and stability of the media are important. Besides crop performance, suitable growing media should also have traits such as availability, cost, weight and reusability. Growing media are materials other than soils, in which plants are grown. Other than peat, there are various organic materials such as perlite, vermiculite, rockwool, bark, wood residues, coir, rice hulls, composted materials and others that have been used widely as growing media.

The emphasis was on byproduct organic materials that are locally produced, available and enough supply to be used in large commercial operations. In view of the potential benefits of composted organic wastes as growing media and organic fertilizer, a study was conducted with the objectives:

- 1. To evaluate the use of five types of compost in mixture with peat as growth medium for seedlings of cauliflower.
- 2. To evaluate the growth of cauliflower using compost materials as source of fertilizer in comparison with inorganic fertilizer under protective structure
