Chair: Professor Dato' Ar. Elias @ Ilias bin Salleh, PhD

Faculty: Faculty of Design and Architecture

Malaysian housing industry is facing a huge challenge to provide environmentally sustainable housing developments. The main issue concentrates on thermal performance of building envelopes to improve thermal comfort and energy savings. The major problem of Malaysian domestic housing development is the over heating of roof space caused by inappropriate roofing systems and materials as the roof is the major source of heat gain. The excessive heat gained from the sun will be radiated from the roof space to the occupants through radiation.

Previous studies were done on the evaluation of thermal performance of roofing systems for residential buildings in Malaysia, based on air temperature measurement. However, there is no study focusing on the effect of roofing systems on Mean Radiant Temperature, which will have a direct impact on the thermal exchange between the roof and the occupants. Mean Radiant Temperature of a space is the measure of the combined effects of temperatures of surfaces within that space

such as roof, walls and floor. Therefore, the main objective of this study is to investigate the effect of roofing systems and materials on Mean Radiant Temperature for recommendations of roofing systems and materials for optimum thermal performance under Malaysian climate.

This research involved an observation survey on the common roofing systems and materials for recent domestic housing developments in Malaysia. This was followed by simulations of Mean Radiant Temperature by using the simulation software, Heat Transfer in Buildings HTB2 to evaluate thermal performance of various roofing systems and materials based on the observation survey. Field measurements on Mean Radiant Temperature at first floor level of a double storey terrace house in Kuala Lumpur were then carried out by using INNOVA thermal comfort measurement tools. The measured Mean Radiant Temperature was compared with the simulated Mean Radiant Temperature for validation of the software.

The results revealed that among common roofing systems and materials in recent Malaysian domestic housing industry, clay tile with double sided aluminium foil and plasterboard ceiling is able to produce the optimum thermal performance in relation to Mean Radiant Temperature. This is followed by concrete tile roofing system with double sided aluminium foil and plasterboard ceiling, and lastly metal deck roofing system with double sided aluminium foil, rockwool as insulation materials and plasterboard ceiling. From the simulation results, the most effective location for aluminium foil is below the roof tiles compared to on top of horizontal ceiling. However, it is recommended that with additional combination of double sided aluminium foil on top of plasterboard or rockwool as hybrid ceiling, it will

significantly reduce indoor Mean Radiant Temperature. This will reduce the heat exchange between the roof space and the occupants through radiation, and therefore optimising thermal performance of roofing systems under Malaysian climate.

In conclusion, this study demonstrates the importance of choosing appropriate roofing systems and materials for better thermal comfort through the understanding on the effect of roofing systems on Mean Radiant Temperature. The recommended roofing systems and configurations will become useful guidelines for developers, architects, and house owners to improve thermal comfort of residential buildings in Malaysia. Therefore, this study will contribute in promoting energy and cost savings in Malaysian housing industry, as well as the whole country's development.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Master Sains

Industri perumahan di Malaysia sedang menghadapi satu kecabaran besar untuk menyediakan pembangunan perumahan yang berasaskan keseimbangan persekitaran. Isu utama dalam kecabaran ini menumpukan perhatian dalam prestasi terma sampul bangunan bagi meningkatkan keselesaan terma dan penjimatan tenaga. Masalah utama dalam sektor pembangunan perumahan di Malaysia adalah kepanasan melampau pada ruang bumbung yang disebabkan oleh sistem dan bahan-bahan pembuatan bumbung yang tidak sesuai. Ini adalah kerana bumbung adalah punca penerimaan haba yang utama. Haba berlebihan yang didapati daripada punca suria akan diradiasikan daripada ruang bumbung kepada penghuni melalui proses radiasi.

Kajian yang dahulu diusahakan untuk menilai prestasi terma bagi sistem bumbung bangunan kediaman di Malaysia dengan berasaskan pengukuran suhu udara. Bagaimanapun, tiada pengajian yang menumpukan perhatian dalam kesan sistem bumbung terhadap suhu radiasi purata yang mempunyai kesan terus terhadap

penukaran haba yang berlaku di antara bumbung dengan penghuni. Suhu radiasi purata bagi sesebuah ruang adalah suhu yang terkumpul daripada suhu-suhu permukaan dalam ruang tersebut seperti bumbung, dinding dan lantai. Oleh yang demikian, objektif utama bagi penyelidikan ini adalah untuk mengkaji kesan daripada sistem bumbung dan bahan-bahan pembuatan bumbung terhadap suhu radiasi purata dengan bertujuan untuk mencadangkan sistem dan bahan-bahan pembuatan bumbung yang mempunyai prestasi terma yang optima berasaskan cuaca Malaysia.

Penyelidikan ini melibatkan satu kajian ke atas bahan pembuatan dan sistem-sistem bumbung yang umum bagi pembangunan perumahan kebelakangan di Malaysia. Selepas pengajian ini, simulasi komputer ke atas suhu radiasi purata dengan menggunakan program simulasi komputer yang berjenama HTB2 telah diadakan untuk menilai prestasi terma bagi bahan-bahan pembuatan dan sistem-sistem bumbung yang berbagai jenis berdasarkan kajian yang telah diadakan. Seterusnya, pengukuran ke atas suhu radiasi purata bagi tingkat kedua di sebuah rumah teres di Kuala Lumpur telah diadakan dengan menggunakan alat pengukuran keselesaan terma yang berjenama INNOVA. Suhu radiasi purata yang diukur akan dibandingkan dengan suhu radiasi purata yang disimulasikan oleh program simulasi komputer yang berjenama HTB2. Ini adalah bertujuan untuk pengesahan prestasi program simulasi komputer tersebut.

Keputusan simulasi mendapati bahawa di antara sistem dan bahan-bahan pembuatan bumbung umum yang digunakan dalam pembangunan perumahan kebelakangan di Malaysia, jubin bumbung tanah liat bersama-sama dengan lapisan nipis aluminium

dua muka dan siling papan plaster dapat menghasilkan prestasi terma yang optima berasaskan suhu radiasi purata. Yang seterusnya adalah sistem jubin bumbung konkrit dengan lapisan nipis aluminium dua muka dan siling papan plaster. Prestasi terma yang paling rendah adalah pada sistem bumbung jenis logam dengan lapisan nipis aluminium dua muka dan bulu-bulu sebagai bahan insulasi dan siling papan plaster. Keputusan simulasi juga menunjukkan bahawa kedudukan lapisan nipis aluminium yang paling berkesan adalah di bawah jubin bumbung berbanding dengan di atas siling mendatar. Walau bagaimanapun, penyelidikan ini mencadangkan bahawa dengan penambahan lapisan nipis aluminium dua muka di sebelah atas papan plaster atau bulu-bulu sebagai siling hibrid berlapis, suhu radiasi purata dalaman akan dapat diturunkan dengan nyata sekali. Dengan ini, penukaran haba secara radiasi di antara ruang bumbung dan penduduk akan dapat dikurangkan. Justeru itu, prestasi terma sistem bumbung akan dapat dimaksimumkan.

Sebagai kesimpulan, penyelidikan ini telah menunjukkan kepentingan untuk memilih sistem dan bahan-bahan pembuatan bumbung yang sesuai supaya meningkatkan keselesaan terma. Ini dapat dicapai melalui pemahaman yang mendalam atas kesan sistem bumbung terhadap suhu radiasi purata. Sistem-sistem dan konfigurasi bumbung yang dicadangkan dapat dijadikan sebagai panduan yang berguna kepada pemaju-pemaju perumahan, arkitek-arkitek dan pemilih-pemilih rumah untuk meningkatkan prestasi terma bagi rumah-rumah kediaman di Malaysia. Dengan ini, penyelidikan ini akan menyumbang dalam penjimatan tenaga dan pembelanjaan dalam industri perumahan serta pemajuan seluruh negara kita.

ACKNOWLEDGEMENTS

First of all, I would like to express my highest gratitude to my main supervisor, Professor Dato' Dr. Ar Elias bin Salleh, for his invaluable advices, careful guidance and continuous support throughout the course and towards the completion of my studies. My deepest gratitude and appreciation are also expressed to my co-supervisor, Ar. Lim Chin Haw for his supervision and guidance towards the completion of my studies. My appreciation also extended to co-supervisor Ar. Meor Mohammad Fared, for his continuous support and encouragements throughout my studies.

I also wish to express my heartiest thankfulness to the Deputy Dean of the Faculty of Design and Architecture, Associate Professor Dr. Rahinah Ibrahim, for her great support and encouragements throughout my studies. I would like to extend my thankfulness to all other staff members from the faculty for their time and contributions towards the completion of my studies.

My sincere appreciation also goes to Professor Phil Jones, the Head of Welsh School of Architecture from Cardiff University, for his kind contributions in the guidance, directions and fruitful discussions on the application of the building thermal simulation software applied in my research, Heat Transfer in Buildings, HTB2.

Last but not least, I would like to express my warmest thanks to my wife, Alice, for her continuous support and encouragements all the time.

I certify that an Examination committee has met on **9 April 2008** to conduct the final examination of Allen Lau Khin Kiet on his Master of Science (Architectural Studies) thesis entitled “Thermal Performance of Roofing Systems in Relation to Radiant Heat in Malaysian Residential Buildings” in accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1980 and Universiti Pertanian Malaysia (Higher Degree) Regulations 1981. The Committee recommends that the student be awarded the Master of Science.

Members of the Examination Committee were as follows:

Prof. Madya Dr. Hjh Rahinah Ibrahim, PhD

Timbalan Dekan
(Penyelidikan, Siswazah dan Pengantarabangsaan)
Fakulti Rekabentuk dan Senibina
Universiti Putra Malaysia
(Chairman)

Dr. Ar. Azizah Salim Syed Salim, PhD

THERMAL PERFORMANCE OF ROOFING SYSTEMS IN RELATION TO THE MEAN RADIANT TEMPERATURE IN MALAYSIAN RESIDENTIAL BUILDINGS

Oleh

ALLEN LAU KHIN KIET

April 2008

Pengerusi: Profesor Dato' Ar. Elias @ Ilias bin Salleh, PhD

Fakulti: Fakulti Rekabentuk dan Senibina

Industri perumahan di Malaysia sedang menghadapi satu kecabaran besar untuk menyediakan pembangunan perumahan yang berasaskan keseimbangan persekitaran. Isu utama dalam kecabaran ini menumpukan perhatian dalam prestasi terma sampul bangunan bagi meningkatkan keselesaan terma dan penjimatan tenaga. Masalah utama dalam sektor pembangunan perumahan di Malaysia adalah kepanasan melampau pada ruang bumbung yang disebabkan oleh sistem dan bahan-bahan pembuatan bumbung yang tidak sesuai. Ini adalah kerana bumbung adalah punca penerimaan haba yang utama. Haba berlebihan yang didapati daripada punca suria akan diradiasikan daripada ruang bumbung kepada penghuni melalui proses radiasi.

Kajian yang dahulu diusahakan untuk menilai prestasi terma bagi sistem bumbung bangunan kediaman di Malaysia dengan berasaskan pengukuran suhu udara. Bagaimanapun, tiada pengajian yang menumpukan perhatian dalam kesan sistem bumbung terhadap suhu radiasi purata yang mempunyai kesan terus terhadap penukaran haba yang berlaku di antara bumbung dengan penghuni. Suhu radiasi purata bagi sesebuah ruang adalah suhu yang terkumpul daripada suhu-suhu

permukaan dalam ruang tersebut seperti bumbung, dinding dan lantai. Oleh yang demikian, objektif utama bagi penyelidikan ini adalah untuk mengkaji kesan daripada sistem bumbung dan bahan-bahan pembuatan bumbung terhadap suhu radiasi purata dengan bertujuan untuk mencadangkan sistem dan bahan-bahan pembuatan bumbung yang mempunyai prestasi terma yang optima berasaskan cuaca Malaysia.

Penyelidikan ini melibatkan satu kajian ke atas bahan pembuatan dan sistem-sistem bumbung yang umum bagi pembangunan perumahan kebelakangan di Malaysia. Selepas pengajian ini, simulasi komputer ke atas suhu radiasi purata dengan menggunakan program simulasi komputer yang berjenama HTB2 telah diadakan untuk menilai prestasi terma bagi bahan-bahan pembuatan dan sistem-sistem bumbung yang berbagai jenis berdasarkan kajian yang telah diadakan. Seterusnya, pengukuran ke atas suhu radiasi purata bagi tingkat kedua di sebuah rumah teres di Kuala Lumpur telah diadakan dengan menggunakan alat pengukuran keselesaan terma yang berjenama INNOVA. Suhu radiasi purata yang diukur akan dibandingkan dengan suhu radiasi purata yang disimulasikan oleh program simulasi komputer yang berjenama HTB2. Ini adalah bertujuan untuk pengesahan prestasi program simulasi komputer tersebut.

Keputusan simulasi mendapati bahawa di antara sistem dan bahan-bahan pembuatan bumbung umum yang digunakan dalam pembangunan perumahan kebelakangan di Malaysia, jubin bumbung tanah liat bersama-sama dengan lapisan nipis aluminium dua muka dan siling papan plaster dapat menghasilkan prestasi terma yang optima berasaskan suhu radiasi purata. Yang seterusnya adalah sistem jubin bumbung

konkrit dengan lapisan nipis aluminium dua muka dan siling papan plaster. Prestasi terma yang paling rendah adalah pada sistem bumbung jenis logam dengan lapisan nipis aluminium dua muka dan bulu-bulu sebagai bahan insulasi dan siling papan plaster. Keputusan simulasi juga menunjukkan bahawa kedudukan lapisan nipis aluminium yang paling berkesan adalah di bawah jubin bumbung berbanding dengan di atas siling mendatar. Walau bagaimanapun, penyelidikan ini mencadangkan bahawa dengan penambahan lapisan nipis aluminium dua muka di sebelah atas papan plaster atau bulu-bulu sebagai siling hibrid berlapis, suhu radiasi purata dalaman akan dapat diturunkan dengan nyata sekali. Dengan ini, penukaran haba secara radiasi di antara ruang bumbung dan penduduk akan dapat dikurangkan. Justeru itu, prestasi terma sistem bumbung akan dapat dimaksimumkan.

Sebagai kesimpulan, penyelidikan ini telah menunjukkan kepentingan untuk memilih sistem dan bahan-bahan pembuatan bumbung yang sesuai supaya meningkatkan keselesaan terma. Ini dapat dicapai melalui pemahaman yang mendalam atas kesan sistem bumbung terhadap suhu radiasi purata. Sistem-sistem dan konfigurasi bumbung yang dicadangkan dapat dijadikan sebagai panduan yang berguna kepada pemaju-pemaju perumahan, arkitek-arkitek dan pemilih-pemilih rumah untuk meningkatkan prestasi terma bagi rumah-rumah kediaman di Malaysia. Dengan ini, penyelidikan ini akan menyumbang dalam penjimatan tenaga dan pembelanjaan dalam industri perumahan serta pemajuan seluruh negara kita.
