1999
AN INVESTIGATION OF COTTON/ EPOXY AND GLASS/ EPOXY COMPOSITE CONES SUBJECTED TO AXIAL COMPRESSION LOAD

By

ASAD ABDULLAH KHALID

Thesis Submitted in Fulfillment of the Requirements for the Degree of Doctor of Philosophy in the Faculty of Engineering Universiti Putra Malaysia

April 1999
ACKNOWLEDGEMENTS

First of all I would like to thank my God (ALLAH) for every thing.

I would like to express my sincere gratitude and deep thanks to my supervisor Associate Professor Dr. Barkawi Bin Sahari for his kind assistance, support, advice, encouragement and suggestions throughout this work and during the preparation of this thesis.

I would like to express my appreciation to Dr. Mustafar Bin Sudin and Dr. Mageed Hammoda. Co-supervisors, for their help, suggestions and assistance during preparation of this thesis. My appreciation is also to Dr. Yousif A. Khalid for his assistance, constructive ideas and suggestions during my research projects.

I acknowledge the help from the head of mechanical and manufacturing engineering department Dr. Megat hamdan and the help from Dr. Shamsuddin Sulaiman.

Great thanks to the external examiner Prof. S. A. Meguid from the Department of mechanical Engineering / Toronto University, Canada for his effort, time spent, valid advice and thesis corrections.

Thank to Associate Prof. Baharuddin Hitam and Mr. Aznijar Ahmad for their help. Appreciation is also due to Puan Mahyon, Mr. Sharani, Mohamad Rashid, Tajul Arifin, Ahmed shaifuldeen, Zulkifli, Suliaman and Mr. John for their help during the experimental work stage of this project.

I would like also to thank all the staff members of the UPM library for their assistance in providing the scientific papers required for this work.

Last but not least, I would like to extend my sincere appreciation to my family, my mother, sisters and my brothers.

## CHAPTER

### I INTRODUCTION 1

- Types of Composite Materials 2
- Mechanical Behavior of Composite Materials 4
- Manufacturing of Fiber Reinforced Composite Materials 6
- Energy Absorption in Composite Materials 7
- Objectives of this Study 9

### II LITERATURE REVIEW 11

- Introduction 11
- Material behavior 13
  - Fiber 13
  - Matrix Materials 20
- Fabrication Methods 24
  - Hand Lay-up 25
  - Filament Winding 25
  - Resin Transfer Molding 26
- Energy Absorption 27
  - Calculation of Specific Energy Absorption 28
- Component Behavior 31
  - Tubular Specimens 31
  - Modes of Progressive Crushing 36
  - Geometry Effect 40
  - Effect of Material Type 50
  - Fiber Architecture 53
  - Effect of Testing Conditions 57
- Predicting Failure Load 62
- Discussion 66
- Conclusions 67

### III THEORETICAL ANALYSIS 69

- Stress-Strain Relation 69
- Compliance Matrix for Orthotropic Materials 72
- Determination of Strength and Stiffness of Composite Laminates 75
Determination of Material Properties of Orthotropic Materials...... 79
  Determination of the Longitudinal Young's Modulus \( E_{11} \)...... 80
  Determination of Transverse Young's Modulus \( E_{22} \)............. 81
  Determination of Major Poisson's Ratio \( \nu_{12} \).................. 82
  Determination of In-Plane Shear Modulus \( G_{12} \)................ 83
  Determination of \( E_{33} \), \( G_{13} \), and \( \nu_{23} \).................... 84
  Determination of \( G_{23} \) and \( \nu_{23} \)........................... 85

Stress-Strain Relation for Plane Stress in an Orthotropic Material
\((\theta=0^\circ \text{ or } \theta=90^\circ)\).............................................. 86
Stress-Strain Relation for a Lamina of Arbitrary Orientation
\((\theta \neq 0^\circ \text{ or } \theta \neq 90^\circ)\).............................................. 87
Lamination Theories of a Composite material......................... 90
  Classical Lamination Theory (CLT)................................. 90
  Effective Stiffness Theory (EST)................................ 92
FEM Applications in a Composite materials.......................... 94
Discussion............................................................... 96

IV EXPERIMENTAL WORK ................................................. 98
Filament Winding Equipment Set-up.................................... 99
Mandrels Fabrication..................................................... 101
Test Specimens Fabrication............................................. 102
  Cones Fabrication..................................................... 102
  Moisture Absorption Specimens................................. 104
Discussion............................................................... 104

V MATERIAL PROPERTIES TESTS ........................................ 106
Fiber and Matrix Properties........................................... 106
  Epoxy Resin Properties test..................................... 106
  Cotton Fiber Properties Test................................. 109
  Glass Fiber Properties Test.................................... 110
Composite Laminate Tensile Testing.................................... 112
  Cotton Fiber/Epoxy.................................................. 113
  Glass Fiber/Epoxy.................................................... 115
Determination of the Composite Materials Properties.................. 117
Tensile Mechanism of failure.......................................... 122
Conclusions............................................................... 124

VI EXPERIMENTAL RESULTS .............................................. 126
Results of Cylindrical Composite.................................... 126
  Introduction........................................................... 126
  Tube Parameter, Material and Test Conditions...................... 126
  Discussion............................................................. 132
  Conclusions.......................................................... 133
Results of Single Composite Cones.................................... 133
  Introduction........................................................... 133
  Cotton Fiber/Epoxy Single Cones................................. 134
  Glass Fiber Epoxy Single Cones.................................. 141
  Comparison............................................................ 147

Results of Combined Composite Cones

Introduction | 164 |
Cotton Fiber/Epoxy Multiple Cones | 165 |
Glass Fiber/Epoxy Multiple Cones | 169 |
Reversed Parallel Multiple Cones | 171 |
Discussion | 173 |
Conclusions | 175 |

Experimental Work Error Sources | 175 |

VII FINITE ELEMENT RESULTS

Introduction | 177 |
Cone Geometry | 177 |
Cotton Fiber/Epoxy Cones | 178 |
Glass Fiber/Epoxy Cones | 179 |
Material Properties | 179 |
Finite Element, Mesh, Loading and Boundary Conditions | 180 |
Results | 182 |
Cotton Fiber/Epoxy | 184 |
Glass Fiber/Epoxy | 184 |
Comparison of Results | 185 |
Finite Element and Experimental results | 185 |
Cotton fiber/Epoxy and Glass Fiber/Epoxy Results | 193 |
Discussion | 194 |
Conclusions | 195 |

VIII DISCUSSION

Introduction | 196 |
Filament Winding Machine Design | 197 |
Factors, Parameters and Limit | 197 |
Equipment Limitation | 197 |
Accuracy | 198 |
Effect of Fiber and Matrix Behavior | 198 |
Fiber Effect | 198 |
Matrix Effect | 199 |
Fiber/Matrix Volume Ratio | 199 |
Effect of Geometry on Crushing Behavior and Energy Absorption | 200 |
Cylinders and Cones | 200 |
Single and Multiple Cones | 201 |
Effect of Material on Crushing Behavior and Energy Absorption | 202 |
Cotton Fiber/Epoxy and Glass Fiber/Epoxy | 202 |
Effect of Moisture on Crushing Energy | 203 |
Finite Element Prediction | 203 |
Method Applied 203
Accuracy of Prediction 204
Limitation 205

Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfillment of the requirements for the degree of Doctor of Philosophy

AN INVESTIGATION OF COTTON/ EPOXY AND GLASS/ EPOXY COMPOSITE CONES SUBJECTED TO AXIAL COMPRESSIVE LOAD

By

ASAD ABDULLAH KHALID

April 1999

Chairman: Associate Professor Ir. Dr. Barkawi Bin Sahari, B.Sc. (Hons), Ph.D. MIEM, P. Eng.

An experimental and finite element investigation of cotton fiber/ epoxy and glass fiber/ epoxy composite cones and cylinders were carried out under axial compressive loading. A filament winding equipment have been designed and fabricated to produce the different cones and cylinders required for this project. Throughout this investigation, cones of 5\(^\circ\), 10\(^\circ\) and 20\(^\circ\) angles, for two fiber orientation angles of 90\(^\circ\) and 80\(^\circ\) were studied. The effect of quasi-static axial compressive load and specific energy absorption for single cylinder and cone were studied. Besides that, the effect of arrangement type for two cones on the standing load and energy absorption were also examined.

The effect of moisture absorption on the load capability and on the energy absorption of the composite cones have been carried out under axial loading. This was carried out for cones of 5\(^\circ\) angle and 90\(^\circ\) fiber orientation angle. Cones tested were preconditioned by total immersion in to a distilled hot water at 35 °C, 50°C, 65°C and 80°C for different periods ranging from 24 hour to saturation time.
Mechanical properties of the composite material were evaluated experimentally by the testing of tensile specimens for composites, fiber and matrix. Another set of specimens were also tested for the moisture content effect.

Results from this study show that cylinders under axial compression tests indicate better stable crushing behavior than cones. For all cases, glass/epoxy cones or cylinders show higher absorption energy than cotton/epoxy type by 5% to 12.5% for the different cases.

It was found that a significant improvement in the crushing load and energy absorption occurs when using single cones of fiber orientation angle of 80° instead of 90° and the difference was very significant when using cones angles of 20° instead of 5°. Cones arranged in ordinary parallel stands higher load of 27.7% and higher specific energy absorption of 28.3% than similar cones arranged in series for glass/epoxy type. These percentages were 29.7% and 29.4% respectively for cotton/epoxy cones.

Comparison for load-displacement relations were done between cones with and without moisture preconditioning. It was found that the crushing energy absorption decreases with increase in moisture content.

Finite element study has also been carried out for similar cones. Surface and side nodes displacements were obtained for cotton and glass/epoxy cones under axial compression loading. The slope of the elastic region for the different cones studied was compared with the experimental results and found in the range between 1.73% to 14.44%.

PENYIASATAN KEATAS KON RENCAM BENANG KAPAS/ EPOXI
DAN KACA/ EPOXI YANG DIBAWAH BEBAN MAMPATAN PAKSI

Oleh

ASAD ABDULLAH KHALID

April 1999

Pengerusi: Professor Madya Ir. Dr. Barkawi Bin Sahuri,
B.Sc. (Hons), Ph.D. MIEM, P. Eng.

Fakulti : Kejuruteraan

Satu eksperimen dan pengkajian unsur terhingga komposit kon dan silinder bagi
gentian kapas/ epoksi dan gentian kaca/ epoksi adalah dijalankan dengan bebanan tekanan
sepaksi. Peralatan belitan filamen direkabentuk dan dipasang untuk menghasilkan kon dan
silinder yang berbeza yang diperlukan untuk projek ini. Melalui pengkajian ini, kon
bersudut 5°, 10° dan 20°, untuk dua orientasi gantian bersudut 90° dan 80° telah dikaji.
Kesan beban tekanan kuasi-statik sepaksi dan penyerapan tenaga spesifik untuk silinder
tunggal dan kon telah dikaji. Selain itu, kesan dari jenis penyesuaian untuk dua kon semasa
beban berdiri dan penyerapan tenaga turut diperiksa.

Kesan penyerapan kelembapan ke atas keupayaan bebanan dan penyerapan tenaga
bagi kon komposit telah dijalankan di bawah beban sepaksi. lanya dijalankan bagi kon
bersudut 5° dan orientasi gentian bersudut 90°. Kon-kon yang diuji telah dirawat dengan
merendam keseluruhannya ke dalam air panas pada suhu 35°, 50°, 65° dan 80° untuk jarak
masa yang berbeza dari 24 jam.
Sifat-sifat mekanikal untuk bahan komposit telah dinilai secara eksperimen dengan ujian tegangan spesimen untuk komposit, gentian dan matriks. Satu set eksperimen yang lain turut diuji untuk kesan kandungan kelembapan.

Keputusan daripada kajian ini menunjukkan bahawa ujian silinder yang ditindaki mampatan sepaksi menunjukkan tingkah-laku perlanggaran stabil yang lebih baik daripada kon. Untuk kesemua kes, kon kaca/epoksi atau silinder menunjukkan penyerapan tenaga yang lebih tinggi berbanding untuk kes yang berbeza.

Diperolehi bahawa peningkatan yang nyata di dalam beban perlanggaran dan penyerapan tenaga muncul ketika menggunakan gentian kon tunggal berorientasikan sudut 80° dibandingkan dengan 90° dan perbezaan memang jelas nyata ketika menggunakan kon bersudut 20° berbanding 5°. Kon-kon yang disusun secara selari menahan beban yang lebih tinggi sebanyak 27.7% dan penyerapan tenaga spesifik yang lebih tinggi sebanyak 28.3% daripada kon-kon yang serupa dan disusun secara bersiri bagi jenis kaca epoksi. Peratusan bagi kon benang kapas/epoksi adalah 29.7% dan 29.4% masing-masing.

Perbandingan untuk perhubungan beban-peralihan telah dilakukan di antara kon-kon dengan dan tanpa lembapan. Telah diperolehi bahawa penyerapan tenaga perlanggaran berkurang dengan penambahan kandungan lembapan.

Kajian unsur terhingga juga dilakukan untuk kon-kon yang sama. Permukaan dan peralihan titik tepi telah diperolehi untuk benang kapas dan kon kaca/epoksi di bawah beban mampatan sepaksi. Kecuraman kawasan elastik bagi kon berbeza yang dikaji telah dibandingkan dengan keputusan eksperimen dan diperolehi dalam nilai antara 1.73% ke 14.44%.
