Everyone who involved in this study...

Abstract of the thesis presented to the Senate of Universiti Putra Malaysia
in fulfilment of requirements for the degree of Master of Science

**ATTAINMENT OF DESIRED MAGNETIC PROPERTIES OF Mg-Zn
FERRITE BY CONTROLLING THE COMPOSITION AND
MICROSTRUCTURE**

By

TAN THIAN KHOON

August 2000

Chairman : Assoc. Prof. Dr. Mansor Hashim

Faculty : Science and Environmental Studies

This research work was conducted to investigate and understand better the characteristics of magnesium based ferrites. Magnesium-based ferrites were chosen due to one of their vital characteristics, that is high electrical resistivity, which can make them better materials at higher operating frequencies. Besides, they have a lower production cost and no environmental effect. Therefore, perhaps, they can be a better substitute to the existing technological ferrites and consequently replacing them. In order to achieve these goals, a wide-scope experimental investigation was conducted. The samples were prepared by the oxide ceramic processing method, involving dry mixing and solid state reactions. The experimental investigation covered the effects of compositional variations in magnesium-based ferrites with iron deficiency, excess zinc, iron deficiency with excess zinc, magnesium-zinc ion exchange and magnesium-iron ion exchange. Additional experimental work was also carried out to study the effects, on microstructure, of the grinding time, pre-sintering temperature, sintering temperature and sintering time. It was found that, in general, iron deficiency and excess zinc was beneficial to obtaining good magnetic properties. For the magnesium-zinc and magnesium-iron ion exchange, there existed particular compositions which yielded optimum magnetic properties. It was also learned

that sintering temperature and time were both very important in achieving the desired properties.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia
bagi memenuhi keperluan untuk ijazah Master Sains

**KEDAPATAN SIFAT MAGNET YANG DIKEHENDAKI KE ATAS FERIT
Mg-Zn DENGAN KAWALAN KOMPOSISI DAN MIKROSTRUCTUR**

Oleh

TAN THIAN KHOON

Ogos 2000

Pengerusi : Prof. Madya. Dr. Mansor Hashim

Fakulti : Sains dan Pengajian Alam Sekitar

Penyelidikan ini dijalankan bagi mengenalpasti and memahami dengan lebih mendalam sifat-sifat ferit berasaskan magnesium. Ferit-ferit berasaskan magnesium dipilih disebabkan oleh salah satu daripada kelebihannya, iaitu sifat kerintangan yang tinggi yang menjadikan bahan tersebut lebih baik pada frekuensi pengoperasian yang lebih tinggi. Di samping itu, mereka mempunyai kos penghasilan yang agak rendah serta tidak mempunyai kesan ke atas alam sekitar. Dengan demikian, adalah diharapkan mereka boleh menjadi pengganti yang lebih baik kepada teknologi ferit yang sedia ada dan seterusnya mengantikan mereka. Bagi mencapai matlamat tersebut, suatu kajian eksperimen meliputi suatu julat yang luas telah dijalankan. Sampel-sampel telah disediakan berdasarkan kaedah pemprosesan oksida seramik, melibatkan kaedah kering dan tindakbalas keadaan pepejal. Kajian eksperimen meliputi kesan terhadap perubahan komposisi di dalam ferit berasaskan magnesium dengan pengurangan bahan besi, lebihan bahan zink, pengurangan bahan besi berserta lebihan bahan zink, penukargantian antara ion magnesium-zink dan penukargantian antara ion magnesium-besi. Di samping itu, kerja eksperimen juga dijalankan bagi mengkaji kesan ke atas mikrostruktur, iaitu masa pemecahan bahan, suhu pra-pembakaran, suhu pembakaran dan julat masa pembakaran. Adalah didapati bahawa, umumnya, pengurangan bahan besi dan lebihan bahan zink amat berfaedah bagi mencapai sifat-sifat magnet yang baik.

Bagi penukargantian antara ion magnesium-zink dan magnesium-besi, didapati wujud tahap komposisi yang boleh mencapai sifat-sifat magnet yang optimum. Ia juga didapati bahawa suhu dan masa pembakaran adalah amat penting bagi mencapai sifat bahan yang diperlukan.

ACKNOWLEDGEMENTS

First of all, I would like to thank my dear supervisor, Assoc. Prof. Dr. Mansor Hashim for his valuable guidance, instruction and patience. He is a person with multiple capabilities in the research industries, especially in the field of the magnetic materials. It's very lovely to work with him.

In addition, I would also like to thank my co-supervisor, Dr. Jamil Suradi and Assoc. Prof. Dr. Chow Sai Pew for their consistent support and help throughout my studies.

I would like to take this opportunity to thank Ms. Azilah Abdul Jalil and her colleagues from the Faculty of Veterinary for their guidance and patience in setting up the SEM equipment for me.

Along the way, as this study was carried out, I have been assisted by many seniors and friends who share their knowledge with me. Few that I would mention here were Noorhana Yahya, Zolman Hari, Thor Soo Fung, Ho Chin Keong, Fanny Chin Yee Ju and many more to mention.

Last but not least is the support and encouragement from my beloved family which has been very caring about my research.
