Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfilment of the requirements for the degree of Master of Science

SYNTHESIS AND CHARACTERIZATION OF NANOCOMPOSITE: 2-4-DICHLOROPHENOXYACETATE–ZINC-ALUMINIUM-HYDROTALCITE-LIKE LAYERS

By

JUNAINAH BINTI MOHD AMIN

September 2003

Chairman: Professor Mohd Zobir bin Hussein, Ph.D.

Faculty: Science and Environmental Study

A direct intercalation of 2,4-dichlorophenoxyacetate (2,4-D) into Zn-Al-layered double hydroxide (ZAL) was carried out by spontaneous self-assembly technique to produce Zn-Al-2,4-D nanocomposite (ZAD). The aging process was done by conventional and microwave-assisted methods. For both methods, the results showed that the intercalation process resulted in the expansion of the interlayer spacing from 10.7 Å in ZAL to around 19.0 - 24.6 Å in ZAD. Sharp and intense peaks for 003 and 006 reflections indicate well-ordered layered structure which exhibit some common features of layered materials, e.g. narrow, symmetrical and strong peaks at low 2θ values and weaker, less symmetric peaks at higher 2θ values. Further characterization of the resulting materials including organic-inorganic content, surface area and porosity, thermal analysis and morphology, were also carried out.

Both ZAL and ZAD have the capacity to neutralize aqueous solutions at different initial pH values. Deintercalation of 2,4-D from the interlayer of ZAD was achieved with sodium carbonate, buffer phosphate, sodium dihydrogen phosphate and sodium acetate solutions. In general, the release percentage of 2,4-D increased with time. Thermal decomposition on ZAL and ZAD was carried out by calcination of the resulting materials for 5 hours at different temperatures. Thermal decomposition of ZAL resulted in the formation ZnO phase. The LDH phase was no longer detected at temperature 300 °C. The surface area was found to increase as the temperature increased. This feature indicated that the layered clay-like structure was destroyed due to the formation of new a phase (ZnO phase). For ZADs, the layered structure was retained to at least 400 °C. However, at 450 °C, the layered structure completely collapsed due to the removal of the structural water and CO₂ from the interlayer together with the decomposition of the organic moiety of ZAD. The ZnO phase which was already observed in unheated ZAD became more prominent at 225 °C. The intensity of the peaks increased as the temperature was increased thereafter. The ZnAl₂O₄ spinel phase was also observed at 750 °C and became more prominent at 1000 °C. The surface area was found to decrease around 150 °C, constant at around 225 – 400 °C and increase at around 450 – 1000 °C. ZAD supplemented in the liquid culture media contributed to the multiplication of cultured cells.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk Ijazah Master Sains

PENYEDIAAN DAN PENCIRIAN NANOKOMPOSIT: LAPISAN SEAKAN HIDROTALSIT BAGI 2-4-DIKLOROFENOKSIASETAT–ZINK-ALUMINIUM

Oleh

JUNAINAH BINTI MOHD AMIN

September 2003

Pengerusi: Profesor Mohd Zobir bin Hussein, Ph.D.

Fakulti: Sains dan Pengajian Alam Sekitar

Penyisipan terus 2,4-diklorofenoksiasetat ke dalam Zn-Al-hidroksida berlapis ganda (ZAL) telah dilakukan dengan kaedah pembentukan sendiri untuk membentuk nanokomposit Zn-Al-2,4-D (ZAD). Proses penuaan dilakukan dengan cara konvensional dan bantuan gelombang mikro. Melalui kedua-dua cara ini, nanokomposit yang terbentuk mengalami pengembangan jarak antara ruang untuk hidroksida berlapis ganda tersebut daripada 10.7 Å kepada 19.0-24.6 Å. Puncak yang tajam dan bersimetri pada puncak 003 dan 006 dalam corak pembelauan sinar-X menunjukkan bahawa nanokomposit yang diperolehi mempunyai struktur lapisan nano yang lebih tersusun, puncak yang tajam dan bersimetri pada nilai 2θ yang tinggi. Pencirian yang lain seperti kandungan organik-tak organik, luas permukaan dan keliangan, analisis terma dan morfologi permukaan juga telah dilakukan. Kedua-dua ZAL dan ZAD menunjukkan kuasa peneutralan dan penimbangan yang baik terhadap larutan akues pada pH awal yang berbeza. Deinterkalasi

anion 2,4-D daripada ruang antara lapisan ZAD telah dilakukan dalam larutan akues natrium karbonat, penimbal fosfat, natrium dihidrogen fosfat dan natrium asetat. Pada umumnya, peratus pembebasan 2,4-D bertambah dengan masa. Penguraian terma juga telah dikaji dengan memanaskan ZAL dan ZAD selama 5 jam pada suhu-suhu tertentu dan pencirian juga telah dilakukan. Penguraian terma ke atas ZAL membawa kepada pembentukan fasa ZnO. Fasa LDH tidak lagi kelihatan pada suhu 300 °C. Luas permukaannya didapati bertambah dengan kenaikan suhu. Ini menunjukkan bahawa struktur seakan tanah liat berlapis telah runtuh kerana wujudnya fasa baru (fasa ZnO). Bagi ZAD pula, struktur berlapis kelihatan hanya pada suhu sekurang-kurangnya 400 °C. Walaubagaimanapun, pada suhu 450 °C, struktur berlapis runtuh dengan sempurna disebabkan oleh kehilangan air, karbon dioksida serta penguraian sebahagian komponen organik ZAD. Fasa ZnO yang sudah sedia ada pada ZAD yang tidak dipanaskan menjadi lebih jelas pada suhu 225 °C. Keamatan puncaknya bertambah dengan kenaikan suhu pemanasan. Fasa spinal $ZnAl_2O_4$ juga telah dapat dilihat dengan lebih jelas pada suhu 750 °C dan 1000 °C. Luas permukaannya pula berkurang pada suhu sekitar 150 °C, tetap pada 225 – 400 °C dan bertambah pada suhu sekitar 450 – 1000 °C. ZAD yang digunakan dalam media kultura menunjukkan ia membantu multiplikasinya.

ACKNOWLEDGEMENTS

Alhamdulillah is the first phrase that comes out of my lips when I am typing this thesis, all praises should go to ALLAH for giving me strength and patience to the completion of this thesis.

First of all, I would like to take this opportunity to express my deepest thanks to my project supervisor, Professor Dr. Mohd Zobir bin Hussein who accepted me as his student. His invaluable guidance and constructive advice very meaningful for me to complete this project.

My thanks also goes to Dr. Ahmad Tarmizi bin Hashim, Associate Professor Dr. Zulkarnain bin Zainal and Dr Asmah binti Hj. Yahaya, who guided me through all the aspects of this work.

I would also like to extend my thanks to all laboratory assistants in Chemistry Department who had in one-way or another assisted me by giving a helping hand when needed. My all lab mates for their kindness, helpful suggestions, extremely supportive and always with apparent good cheer. Puan Zaitun Rasul, Jihan, Ida and all their colleagues for their invaluable help in running of the experiments at Malaysian Palm Oil Board (MPOB).

Last but not least, I would like to acknowledge the financial support of this research by the Ministry of Science, Technology and Environment through National Science Scholarship (NSF) and IRPA grant 09-02-04-00325-EA001.

I certify that an Examination Committee met on 19 September 2003 to conduct the final examination of Junainah Binti Mohd Amin on her Master of Science thesis entitled "Synthesis and Characterization of Nanocomposite: 2-4-Dichlorophenoxyacetate–Zinc-Aluminium-Hydrotalcite-Like Layers" in accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1980 and Universiti Pertanian Malaysia (Higher Degree) Regulations 1981. The Committee recommends that the candidates be awarded the relevant degree. Members of the Examination Committee are as follows:

HALIM BIN ABDULLAH, Ph.D.

Professor
Faculty of Science and Environmental Studies
Universiti Putra Malaysia
(Chairman)

MOHD ZOBIR BIN HUSSEIN, Ph.D.

Professor
Faculty of Science and Environmental Studies
Universiti Putra Malaysia
