NUTRITIONAL EVALUATION OF UNTREATED AND UREA-TREATED RICE STRAW FOR IMPROVED UTILIZATION BY GOATS

By

ANDREW ALEK TUEN.

Thesis Submitted in Fulfilment of the Requirements for the Degree of Doctor of Philosophy in the Faculty of Veterinary Medicine and Animal Science, Universiti Pertanian Malaysia

June 1992
ACKNOWLEDGEMENTS

I would like to express my sincere gratitude and appreciation to Professor Dr. Mohd Mahyuddin Dahan for his guidance and supervision during the course of this study and also for giving me the opportunity to serve in the Department of Animal Science, UPM Serdang, where this study was conducted.

I am grateful to my colleagues and especially Drs. Kassim Hamid and Tengku Azmi, formerly Heads of Department of Animal Science, for their encouragement and permission to use the facilities in the department. I would also like to thank Dr. Pravee Vijchulata for his supervision at the beginning of the program.

Technical assistance from En. Sapar in Demin, En. Sharin Ahmad, Cik Norizah Adam, En. Ibrahim Moshin, En. Rahman and En. Bakari is gratefully acknowledged.

My special thanks goes to Dr. Ramli Othman, formerly Head of Radiobiology Section, PUSPATI, for providing the mutant rice straw analysed in chapter III and for permission to use some of his data on the physical attributes of the mutant straw.
Financial support from UPM (Malaysian Government), International Atomic Energy Agency (Austria) and International Foundation for Science (Sweden) is gratefully acknowledged.

Finally I would like to thank my wife Dr. Anna Inggriana, sons Christopher and Michael and my parents for their patience and understanding.

Abstract of thesis submitted to the Senate of Universiti Pertanian Malaysia in fulfilment of the requirements for the degree of Doctor of Philosophy.

NUTRITIONAL EVALUATION OF UNTREATED AND UREA-TREATED RICE STRAW FOR IMPROVED UTILIZATION BY GOATS

by

ANDREW ALEK TUEN

June 1992

Supervisor: Professor Dr. Mohd. Mahyuddin Dahan
Faculty: Veterinary Medicine and Animal Science

Rice straw is seldom used as goat feed despite reports of higher intake and digestibility of poor quality roughage by this species. Studies were conducted to evaluate local rice straw, define its limitation and investigate means to improve its utilization by goats.

Compositional and degradability studies showed that untreated rice straw is deficient in N and several minerals and is poorly degraded. Calcium hydroxide and sodium hydroxide treatment increased degradability but the treated material was less acceptable to goats compared to rice straw treated with urea or ammonium hydroxide which has relatively lower degradability. Treatment with nitric acid removed all the hemicellulose and was totally unacceptable to goats.

The ad libitum intake and in vivo digestibility of urea-treated straw was higher than that of urea supplemented straw and untreated straw. Studies with
fistulated goats indicated a sustained high level of ammonia and volatile fatty acids in the rumen fluid of goats fed with urea-treated rice straw. There was no significant difference in their rates of passage. It was concluded that the higher intake of urea-treated straw was due to improved rumen function and not due to higher rates of passage.

Radioisotope dilution studies showed that endogenous P secretion into the digestive tract of goats fed urea-treated rice straw was high. As a result goats fed urea-treated straw require more P (76 mg/kg W/d) than goats fed untreated or urea supplemented straw (28 and 30 mg/kg W/d, respectively). Clearly when an improved diet such as urea-treated straw is fed to animals their requirement for mineral is considerably increased.

Mineral supplementation of goats fed urea-treated rice straw increased feed intake, growth rate and Ca and P retention. Further supplementation with urea gave no additional response but growth rate was increased with soya bean meal supplement. This shows that the supply of rumen ammonia to microbes has been met in goats fed urea-treated rice straw. Calcium retention was not improved with either urea or soya bean meal supplement. Phosphorus retention was increased with soya bean meal supplement due to the high concentration of phosphorus in this feed.
It was concluded from these studies that although urea treatment increased the nitrogen content, organic matter intake and digestibility of rice straw by goats, further improvement in animal growth can be obtained by providing adequate minerals and protein.
Abstrak tesis yang dikemukakan kepada Senat Universiti Pertanian Malaysia sebagai memenuhi keperluan untuk izazah Doktor falsafah.

PENILAIAN JERAMI PADI YANG TIDAK DIRAWAT DAN YANG DIRAWAT DENGAN UREA UNTUK PENGUNAAN YANG LEBIH CEKAP OLEH KAMBING

oleh

ANDREW ALEK TUEN

October 1991

Penyelia: Professor Dr. Mohd. Mahyuddin Dahan
Fakulti: Kedoktoran Veterinar dan Sains Peternakan

Jerami padi jarang digunakan sebagai makanan kambing walaupun ada laporan yang mengatakan kambing boleh memakan dan mencernakan bahan bergentian bermutu rendah dengan lebih sempurna. Kajian telah dibuat untuk menentukan had pemakanan jerami padi tempatan dan menyelidik kaedah untuk memperbaiki kegunaan jerami oleh kambing.

Kajian komposisi dan kebolehurai (degradability) menunjukkan bahawa jerami padi yang tidak dirawat kekurangan nitrogen dan zat galian serta sukar diurai. Prarawatan dengan kalsium dan natrium hidroksida meningkatkan kebolehurai jerami padi, tetapi jerami yang dirawat itu kurang digemari oleh kambing berbanding dengan jerami yang dirawat dengan urea atau ammonium hidroksida walaupun nilai kebolehurai nya agak rendah. Prarawatan dengan asid nitrik telah menghilangkan kesemua hemiselulros dari jerami dan jerami yang dirawat itu tidak digemari oleh kambing.
Pengambilan makanan *ad libitum* dan pencernaan *in vivo* jerami yang dirawat dengan urea adalah lebih tinggi berbanding dengan jerami yang ditambah dengan urea atau jerami yang tidak dirawat. Kajian dengan kambing berfistula rumen menunjukkan paras ammonia dan asid lemak meruap yang berkekalan tinggi dalam cecair rumen kambing yang memakan jerami rawatan urea. Perbezaan kadar pemindahan makanan pepejal antara kumpulan perlakuan tidak nyata. Dengan ini boleh disimpulkan bahawa peningkatan pengambilan makanan oleh kambing yang diberi jerami rawatan urea adalah kerana fungsi rumen yang lebih baik dan bukan kerana kadar pemindahan makanan yang lebih cepat.

Kajian pencairan radioaktif menunjukkan rembesan fosforus ke saluran pencernaan kambing yang memakan jerami rawatan urea adalah lebih tinggi. Akibatnya kambing yang memakan jerami rawatan urea memerlukan lebih banyak P (76 mg/h/kg) berbanding dengan kambing yang memakan jerami yang tidak dirawat dan jerami yang ditambah dengan urea (28 dan 34 mg/h/kg masing-masing). Adalah jelas bila makanan yang telah ditingkatkan mutunya, seperti jerami yang dirawat dengan urea, diberi kepada ternakan, keperluan zat galiannya akan bertambah.

Suplementasi zat galian kepada kambing yang memakan jerami yang dirawat dengan urea meningkatkan pengambilan makanan, kadar tumbesaran dan penyimpanan Ca dan P. Suplementasi lanjutan dengan urea tidak membawa apa-apa
