Effects of pH value on the electrodeposition of Cu4SnS4 thin films.

ABSTRACT

Copper tin sulfide thin films were electrodosposited on the indium tin oxide substrates in a bath containing CuSO4, SnCl2 and Na2S2O3 solutions. Various pH values ranging from 1.1 to 1.5 were attempted in order to determine the optimum condition for electrodeposition process. The structure and morphology of the films were studied by using X-ray diffraction and atomic force microscopy, respectively. The band gap energy and absorption properties were determined using UV-VIS spectrophotometer. The thin films produced were polycrystalline in nature. The XRD patterns showed that the most intense peak at 2 = 30.2° which belongs to (221) plane of Cu4SnS4. As the pH was increased, the grain size of this film was much smaller and has complete coverage over the substrate surface. The film showed good uniformity and produced higher absorbance value at pH 1.5. The band gap energy of this film was found to be 1.5 eV.
