

The Effect of Magnetic Nanoparticles Addition on The Superconducting Properties of Bi_{1.6}Pb_{0.4}Sr₂Ca₂Cu₃O_δ Superconductors

ABSTRACT

Sm₂O₃ nanoparticle was added to Bi-2223 superconductor prepared by solid state reaction technique with intermediate grinding. A stoichiometric precursor of x=0.00-0.05 Sm₂O₃ nanoparticle is systematically added to the well balanced Bi_{1.6}Pb_{0.4}Sr₂Ca₂Cu₃O_δ in order to trace the effect of nanoparticles addition to the system. Microstructure, resistive transitions, phase volume, and cell parameters were hence investigated. Addition of Sm₂O₃ nanoparticle is found to slowly decrease the Bi-2223 phase volume and the resistive transitions for x=0-0.02 samples whereas accelerated formation of the Bi-2212 phase is detected for further additions. Changes in superconducting properties of Sm-added Bi-2223 system were discussed and the findings were further compared with available literature
