DEVELOPMENT OF A CUT-SLOPE STABILITY ASSESSMENT SYSTEM FOR PENINSULAR MALAYSIA

By

SUHAIMI BIN JAMALUDIN

Thesis Submitted to the School of Graduate Studies, Universiti Putra Malaysia, in Fulfilment of the Requirement for the Degree of Master of Science

January 2006
Specially Dedicated to My Whole Family
The purpose of this research is to evaluate the accuracy of four existing slope assessment systems (SAS) in Malaysia in predicting landslides on granitic and sediment/metasediment formation slopes. The four existing SAS in Malaysia are namely Slope Management System (SMS), Slope Priority Ranking System (SPRS), Slope Information and Management System (SIMS), and Slope Management and Risk Tracking System (SMART).

Assessment on 139 slopes underlain by granitic formation from the Gunung Raya Road, the East-West Highway and the Kuala Kubu Baru – Gap Road showed that none of the existing SAS is satisfactory for predicting landslide. The most accurate prediction was made by SMART System with only 61% accuracy. For the assessment of 47 slopes underlain by sediment/metasediment formation from the Gunung Raya Road and the East-West Highway, the results showed that the accuracy produced by the SMART
System was 90%, which was considered as very good prediction. None of the other three SAS gave satisfactory prediction.

Based on the accuracy evaluation above, two new SAS models were developed for the slopes in granitic formation. Using the slope database (139 cut-slopes) from the Gunung Raya Road, the East-West Highway and the Kuala Kubu Baru – Gap Road, twenty five slope parameters was analysed for development of the new SAS. Development of Model 1 using stepwise discriminate analysis found that ten slope parameters, namely; slope angle, feature area, distance to ridge, slope shape, percentage of feature uncovered, presence of rock exposure, rock condition profile, presence of bench drain, horizontal drain and sign of erosion were significant in predicting landslides occurrences. However, development of Model 2 using stepwise linear regression analysis found that only nine of the parameters (same parameters as Model 1 except without rock condition profile) were significant. The overall correct classification for Model 1 and Model 2 were 77% and 73% respectively.

In order to validate the accuracy of these two newly developed SAS, slope assessment was carried out on two sites which were different from the ones used in the development of the new SAS models. The assessment on 36 slopes underlain by granitic formation from the Kuala Lumpur – Bentung Old Road and the Tapah – Cameron Highland Road, found that the accuracy in predicting landslides by Model 1 and Model 2 is 88% and 84% respectively. Hence the degree of accuracy by the 2 newly developed models is within the accuracy produced by other previous researchers.
Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Sarjana Sains.

PEMBANGUNAN SISTEM PENILAIAN KESTABILAN CERUN POTONGAN BAGI SEMENANJUNG MALAYSIA

Oleh

SUHAIMI BIN JAMALUDIN

Januari 2006

Pengerusi : Profesor Madya Bujang Bin Kim Huat, PhD
Fakulti : Kejuruteraan

Tujuan kajian ini adalah untuk menilai ketepatan empat sistem penilian cerun (SAS) di Malaysia; Sistem Pengurusan Cerun (SMS), Sistem Turutan Keutamaan Cerun (SPRS), Sistem Maklumat dan Pengurusan Cerun (SIMS), dan Sistem Pengurusan dan Penjejakan Risiko Cerun (SMART) dalam meramal kejadian tanah runtuh di cerun potongan yang di dasari batuan granit dan sediment/metasediment.

Hasil penilaian terhadap 139 cerun potongan didasari batuan granit dari Jalan Gunung Raya, Lebuhraya Timur – Barat dan Jalanraya Kuala Kubu Baru – Gap menunjukkan tiada sebarang SAS sedia ada memuaskan dalam meramal kejadian tanah runtuh, dengan ketepatan tertinggi dihasilkan oleh SMART iaitu hanya 61%. Bagi penilaian terhadap 47 cerun potongan di dasari batuan sediment/metasediment dari Jalan Gunung Raya dan Lebuhraya Timur – Barat menunjukkan ketepatan yang dihasilkan oleh SMART adalah sangat baik dengan ketepatan 90%, tetapi baki tiga SAS lain tiada yang memuaskan.
Berdasarkan hasil penilaian ketepatan di atas, dua SAS baru telah dibangunkan bagi cerun potongan didasari batuan granit. Menggunakan pengkalan data cerun (139 cerun potongan) daripada Jalan Gunung Raya, Lebuhraya Timur – Barat dan Jalanraya Kuala Kubu Baru – Gap, dua puluh lima parameter cerun telah dianalisa dalam pembangunan model baru ini. Pembangunan Model 1 menggunakan analisa *stepwise discriminant* mendapati sepuluh parameter cerun (sudut cerun, luas muka cerun, jarak ke rabung, bentuk cerun, peratusan muka cerun yang terdedah, keujudan dedahan batu, profil keadaan batuan, keujudan saliran batas, keujudan saliran datar dan keujudan hakisan) memberi makna dalam meramal tanah runtuh. Walaubagaimanapun, pembangunan Model 2 berdasarkan analisa *stepwise linear regression* mendapati sembilan parameter cerun (parameter yang sama kecuali tanpa profil keadaan batuan) memberi makna dalam meramal tanah runtuh. Peratus pengkelasan betul bagi keseluruhan cerun gagal dan tidak gagal ialah 77% bagi Model 1 dan 73% bagi Model 2.

Bagi mengesahkan ketepatan SAS baru ini, penilaian cerun telah dijalankan di dua tapak berlainan dari yang digunakan untuk membangunkan dua SAS baru. Hasil penilaian ke atas 36 cerun potongan didasari batuan granit dari Jalan Lama Kuala Lumpur – Bentung dan Jalanraya Tapah – Cameron Highland, mendapati ketepatan dalam meramal kejadian tanah runtuh yang dihasilkan oleh Model 1 dan Model 2 ialah masing-masing 88% dan 84%, dalam lingkungan ketepatan yang dihasilkan oleh penyelidik terdahulu.
ACKNOWLEDGMENTS

In the name of Allah, the most Merciful and most Gracious

The author’s grateful thanks and profound appreciation to his Chairman of the supervisory committee, Associate Professor Dr. Bujang bin Kim Huat whose assistance, guidance and constructive discussions throughout this work are greatly acknowledged. Alongside Dr. Bujang, particular gratitude is also due to the member of the supervisory committee, Associate Professor Dr. Husaini bin Omar for his supportive ideas and encouragement. To the author’s course colleagues and MTDRC staff, Miss Asmidar, Miss Azwati, Mr Syamsul, Mr Shahril, Miss Irfah, Mr Rozaini and Mr. Ridzuan, thanks for the opportunity to exchange ideas and for the friendships that have developed throughout the time. May our relationships grow deeper with every passing year.

The author also wishes to thank his officers and colleagues of the Road Maintenance Section and the Slope Engineering Branch, Public Works Department of Malaysia, particularly Dr. Ir. Hj. Ahmad Nadzri, Mr. Roslan, Tn. Hj. Abu Haris, Mr. Kamar, Ms Devi and Miss Ho for their help and kind assistance in sourcing the data and other materials required for the study.

Lastly, the author’s deep appreciation goes to his beloved wife, Ms Hanishah for her patience and encouragement, and for the only son, Syaqir, his innocence and curiosity are the author’s main sources of inspiration especially during the tough times.
I certify that an Examination Committee has met on 24th January 2006 to conduct the final examination of Suhaimi bin Jamaludin on his degree of Master of Science thesis entitled “Development of a Cut-Slope Stability Assessment System for Peninsular Malaysia” in accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1980 and Universiti Pertanian Malaysia (Higher Degree) Regulation 1981. The Committee recommends that the candidate be awarded the relevant degree. Members of the Examination Committee are as follow:

**Lee Teang Shui, PhD**  
Associate Professor  
Faculty of Engineering  
University Putra Malaysia  
(Chairman)

**Ratnasamy Muniandy, PhD**  
Associate Professor  
Faculty of Engineering  
University Putra Malaysia  
(Internal Examiner)

**Jamaloddin Noorzaei, PhD**  
Associate Professor  
Faculty of Engineering  
University Putra Malaysia  
(Internal Examiner)

**Roslan Hashim, PhD**  
Associate Professor  
Faculty of Engineering  
University of Malaya  
(External Examiner)

Professor / Deputy Dean  
School of Graduate Studies  
Universiti Putra Malaysia

Date:
This thesis submitted to the Senate of Universiti Putra Malaysia has been accepted as fulfilment of the requirement for the degree of Master of Science. The members of the Supervisory Committee are as follows:

**Bujang Kim Huat, PhD**
Associate Professor
Faculty of Engineering
University Putra Malaysia
(Chairman)

**Husaini Omar, PhD**
Associate Professor
Faculty of Engineering
University Putra Malaysia
(Member)

---

**AINI IDERIS, PhD**
Professor / Dean
School of Graduate Studies
Universiti Putra Malaysia
