INNOVATIVE: Steps are under way to promote national competency in the aerospace sector

BUILDING aircraft requires perfection in a coordinated manufacturing process that ranks among the most complex of any industry, involving hundreds of suppliers and the assembly, integration and certification of thousands of individual components.

Competing in the aerospace world demands skills, technology and resources beyond the requirements of almost all other industries. But it's an industry that certainly has the potential to aerodynamically lift Malaysia's fortunes to the sky. Our country has all the necessary ingredients for success: geographic location, “business-friendly” government policies and stability, infrastructure and highly skilled human resources. Among Malaysia's other advantages: internationally recognised safe aviation and legal frameworks.

Aerospace embraces many advanced technologies and offers abundant opportunities in engineering, electronics, composite materials as well as manufacturing and systems integration. Further developing the sector here, therefore, will help us acquire higher technology and build skills, many of them transferable to other industries.

Today, Malaysia has approximately 200 aerospace-related organisations, with estimated combined earnings of more than RM27.5 billion and more than 54,000 employees. The critical underpinnings for all of these enterprises are science, technology and innovation in a modern economy.

Science, technology and innovation are important contributors to economic growth and crucial factors determining the market competitiveness of firms both nationally and internationally.

Research and development (R&D) are widely recognised prerequisites of technological advancement, and levels and rates of growth of R&D expenditures are viewed as reliable indicators of innovative capacity.

The 10th Malaysia Plan aims to ensure that investment in R&D reaches at least one per cent of gross domestic product by 2015. Achieving this target requires a bold commitment of funding not only from the public sector but also more importantly from the private enterprise.

According to the university, AMRC “is dedicated to enabling UK manufacturers to create better, faster, cheaper, easier and greener products using composite materials”.

“The build on the shared scientific excellence, expertise and technological innovation of the world’s leading aerospace companies, and world-class research within the University of Sheffield's Faculty of Engineering.”

It also pursues research into composite materials, “an area crucial to the development of Boeing’s next generation aircraft”.

AMRC is situated on an Advanced Manufacturing Park, where it is co-located with other internationally significant research and technology transfer organisations.

AMIC is an R&D centre of excellence and single out AMIC as a work in progress that propels Malaysia towards the industrialised, high-tech country we aspire to.

The unique university-industry research collaboration exemplified by AMIC is a work in progress that provides a model for the Malaysian Research University Network to follow.

Key R&D priorities identified by AMIC include:

**INNOVATIVE manufacturing of aerospace composites structures:**

**NEW green materials for use in aerospace manufacturing:**

**IMPROVED technologies for systems integration:**

With Malaysia's abundant biodiversity, there are high prospects for us to identify, isolate and cultivate micro-algae strains that can eventually yield top-grade jet fuel.

Innovation in manufacturing will include, for example, production time-saving technologies, new methods, cost-efficient design and process simulations.

And, the initiative on new green aerospace materials would include developing eco-friendly materials for cabin and cargo areas.

The unique university-industry research collaboration exemplified by AMIC is a work in progress that propels Malaysia towards the industrialised, high-tech country we aspire to.

It is an effort to tap into the expertise and resources of our friends in the developed world to strengthen our local human capital, while at the same time maximising the sustainable use of our abundant natural resources.
