Half-sweep iterative method for solving two-dimensional Helmholtz equations.

ABSTRACT

The main purpose of this article is to examine the effectiveness of the Half-sweep Gauss-Seidel (HSGS) in solving the sparse linear systems generated from discretization of the two-dimensional Helmholtz equations. In addition, the application and formulation of the HSGS iterative method are also presented. Some illustrative examples are given to point out the efficiency of the proposed method.

Keyword: Finite difference scheme; Gauss-Seidel (GS) method; Half-sweep iteration; Helmholtz equations.
