Faculty : Engineering

This thesis presents the effect of binders on mechanical and physical properties of *Eurycoma longifolia jack* extract's via direct compression. In the Malay's native tongue *Eurycoma longifolia jack* is commonly known as 'tongkat ali'. Traditionally, this herb is used for treating fever, mouth ulcers, hypertension, diabetes and intestinal worms. However, its most popular local use is as an aphrodisiac for men. The main objectives of this study is to investigate the effects of different compression pressures and percentage on binders' composition on binary mixtures of *Eurycoma longifolia jack* extract with binders; κ -Carrageenan and microcrystalline cellulose (MCC). In addition, validations of the compression behaviour through three classical equations were carried out. This was then used to predict the behavior of mixtures in *Eurycoma longifolia jack* formulation. The powders were compressed to various mixture percentages (w/w) ranging between 10 and 70 % and compression pressures ranged between 7.5 and 74 MPa at a constant compression speed of 5 mm min⁻¹. The tensile strength values of the tablets were determined by a diametral compression test.

Generally, it is predicted that *Eurycoma longifolia jack* extract and MCC binary mixtures has a better compressibility property in contrast to *Eurycoma longifolia jack* extract and κ -*Carrageenan* binary mixtures. Furthermore, the tablets produced from *Eurycoma longifolia jack* extract and MCC binary mixtures had good mechanical properties, with tensile strength increasing via compression pressure while the friability values decreased. However, the tablets had poor dissolution properties; it is conclude that while tablet mechanical and physical properties can be produced from the binary mixtures, disintegrants would need to be included in the formulations to ensure sufficient active ingredient release. Additionally, from analysis of variance (ANOVA) results, the effect of the tensile strength was significantly dependent ($P<0.001$ in each case) on both compression pressure and binder percentage. Similarly, there was also a significant interaction ($P<0.001$ in each case) between pressure and binder percentage. Subsequently, the best binary mixture for *Eurycoma longifolia jack* extract is preferably a 30 % of MCC at 0.5 g feed powder quantity. Based on this approach, this study may provide an extensive understanding of *Eurycoma longifolia jack* extract compressibility and may further be used in the development of formulating herbal products.

Keywords: *Eurycoma longifolia jack* extract; microcrystalline cellulose; κ -*Carrageenan*; Binary mixtures; Tensile strength; Compressibility.

Abstraks tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Master Sains

**KESAN PENGIKAT KEATAS SIFAT MEKANIKAL DAN FIZIKAL
EKSTRAK *EURYCOMA LONGIFOLIA JACK* MELALUI MAMPAATAN
KERING**

Tesis ini membentangkan kesan pengikat keatas sifat mekanikal dan fizikal tablet *Eurycoma longifolia jack* melalui proses mampatan terus. Bagi sebutan orang Melayu, *Eurycoma longifolia jack* selalunya dikenali sebagai tongkat ali. Secara tradisional herba ini telah digunakan untuk merawat demam, ulser mulut, tekanan darah tinggi, diabetes dan serangan cacing di dalam usus. Namun demikian, ianya sangat terkenal dikalangan orang tempatan sebagai simulasi keatas rangsangan seksual lelaki. Tujuan utama penyelidikan ini adalah untuk mengkaji kesan tekanan mampatan dan peratusan komposisi pengikat keatas campuran binari dari ekstrak *Eurycoma longifolia jack* dengan pengikat; κ -*Carrageenan* dan selulosa mikrokristal (MCC). Sebagai tambahan, pengesahan sifat mampatan melalui tiga persamaan mampatan telah dilakukan. Ini kemudian digunakan untuk meramalkan sifat campuran formulasi *Eurycoma longifolia jack*. Serbuk-serbuk ini telah dimampatkan dengan variasi peratusan campuran (w/w) dari nisbah 10 dan 70 % dan kadar tekanan mampatan antara 7.5 dan 74 MPa pada kelajuan tekanan tetap 5 mm min⁻¹. Nilai

kekuatan tegangan tablet telah ditentukan melalui ujian mampatan satu arah. Amnya, telah dijangkakan campuran binari ekstrak *Eurycoma longifolia jack* dan MCC mempunyai sifat mekanikal yang baik, dengan kekuatan tegangan meningkat melalui tekanan mampatan sementara nilai fribiliti menurun. Walaubagaimanapun, tablet tersebut mempunyai kelemahan pada sifat larutannya; ini membuktikan semasa sifat mekanikal dan fizikal tablet mampu dicapai daripada campuran binari, bahan pelarut mesti juga ditambah didalam formulasi untuk memastikan bahan aktif penting dileraiakan. Tambahan pula, melalui keputusan variasi analisi (ANOVA), kesan daripada kekuatan tegangan tablet adalah sangat bergantung ($P < 0.001$ bagi setiap kes) kepada tekanan mampatan dan peratus pengikat. Dalam persamaan ini, terdapat juga interaksi penting ($P < 0.001$ bagi setiap kes) antara tekanan dan peratusan pengikat. Kemudiannya, campuran binari terbaik untuk ekstrak *Eurycoma longifolia jack* adalah dijangkakan pada 30 % kandungan MCC pada 0.5 g kuantiti jisim serbuk. Berdasarkan kajian ini, kajian ini mampu menyediakan pemahaman yang luas tentang mampatan ekstrak *Eurycoma longifolia jack* dan boleh digunakan dalam pembangunan produk herba.

ACKNOWLEDGEMENTS

First of all, in the name of Allah s.w.t. most gracious, most merciful; It is with His help and blessing that I have reached to this level of my life journey.

Secondly, my deepest gratitude goes to my thesis supervisor, Dr Yus Aniza Yusof for allowing me to join her team, for her expertise, kindness and most of all, for her patience. I am deeply indebted to her who's helped me in all the time of research for and writing of the thesis. My thanks and appreciation goes to my thesis committee members; Ir. Dr Chin Nyuk Ling and Prof. Dr Suhaila Muhamed. I also like to take this opportunity to express my appreciation to the following who has made it possible for me to complete this study; colleagues and staffs from Faculty of Engineering UPM (Engineering and Food Process Department) especially; Mr. Muhammad Badrushah and Mr Mohd Noh. I want to thank the Pharmaceutical and Biotechnology Department from Faculty of Pharmaceutical UiTM Shah Alam for giving me permission to do necessary research work. I wish to also acknowledge my postgraduate friends; Sobah, Awanis, and Zafirah for all their helps, supports, interests and share of the information together.

Finally my deepest gratitude to my beloved husband (Azrol Shaari), my daughter (Putri Adriana Alysha) and to my loving parents for their pray, sacrifices, understanding, endless support and above all their ever lasting love.

Last, but not least, I thank everyone who gave their support, encouragement and assistance through the years it took to complete the work

I certified that an examination committee has met on 29th March 2010 to conduct the final examination of Aziana Azlin Binti Abdul Hamid on her Master of Science thesis entitled “The Effect of Binders on Mechanical and Physical Properties of *Eurycoma Longifolia Jack* Extract Under Dry Compression” in accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1990 and Universiti Putra Malaysia (Higher Degree) Regulation 1981. The Committee recommended that the candidate be awarded relevant degree.

Members of the Examination Committee were as follows:
