Abstract of thesis presented to the Senate of Universiti Putra Malaysia  
in fulfilment of the requirement for the degree of Master of Science

## **CRYPTANALYSIS OF EL-GAMAL $AA_\beta$ CRYPTOSYSTEM**

By

**ARIF BIN MANDANGAN**

**April 2011**

**Chair: Muhammad Rezal Kamel Ariffin, PhD**

**Institute: Institute for Mathematical Research**

In this research, we strengthen the security of the El-Gamal  $AA_\beta$  Cryptosystem, simply referred as the  $AA_\beta$ -cryptosystem. The key exchange protocol of the  $AA_\beta$ -cryptosystem is analogous to the Diffie-Hellman key exchange protocol. The encryption and decryption processes of the  $AA_\beta$ -cryptosystem are efficient since the operations involved are the simple addition and subtraction modulo 1.

Unfortunately, the  $AA_\beta$ -cryptosystem was successfully attacked by the passive adversary attack. This attack is manipulating the weaknesses of the public key and encrypting/decrypting keys structure. The hard mathematical problem of the  $AA_\beta$ -cryptosystem has been reduced to the Discrete Logarithm Problem Modulo 1 which can be solved by using the passive adversary attack.

As a solution, we redefined the structure of the public key and encrypting/decrypting keys. We propose a new secret parameter that plays an important role in the computation of the encrypting/decrypting keys. Without the correct combination of the secret parameters, the adversary will not be able to compute the encrypting/decrypting keys.

The Discrete Logarithm Problem Modulo 1 for the strengthened  $AA_\beta$ -cryptosystem is more difficult than the previous one. Now the adversary needs to find two secret parameters and this task could not be done via the passive adversary attack.

Furthermore we propose some attacks which aim to get the secret parameters which are used in the calculation of the encrypting/decrypting keys. Those attacks are the exhaustive search attack on the secret parameters and the linear Diophantine equation attack. We show that these attacks fail to get the correct secret parameters efficiently.

Finally we redefined the hard mathematical problem of the strengthened  $AA_\beta$ -cryptosystem. To break the security of the strengthened  $AA_\beta$ -cryptosystem, one needs to find the private key. By choosing sufficiently large private key size, it is computationally infeasible to reveal the value of the private key via the exhaustive search attack. Therefore, the  $AA_\beta$ -cryptosystem has a potential to be a secure cryptosystem.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia  
sebagai memenuhi keperluan untuk ijazah Master Sains

## **ANALISISKRIPTO BAGI SISTEMKRIPTO EL-GAMAL $AA_\beta$**

Oleh

**ARIF BIN MANDANGAN**

**April 2011**

**Pengerusi: Muhammad Rezal Kamel Ariffin, PhD**

**Institut: Institut Penyelidikan Matematik**

Dalam kajian ini, kami memperkuatkan keselamatan Sistemkripto El-Gamal  $AA_\beta$ , secara ringkasnya dirujuk sebagai sistemkripto- $AA_\beta$ . Tatacara pertukaran kekunci bagi sistemkripto- $AA_\beta$  adalah analog kepada tatacara pertukaran kekunci Diffie-Hellman. Proses-proses enkripsi dan dekripsi adalah cekap memandangkan operasi-operasi yang terlibat adalah penambahan dan penolakan modulo 1 yang ringkas.

Malangnya, sistemkripto- $AA_\beta$  telah berjaya diserang dengan serangan musuh pasif. Serangan ini dibangunkan dengan memanipulasi kelemahan-kelemahan struktur kekunci awam dan kekunci mengenkripsi/mengdekripsi. Masalah ber matematik payah bagi sistemkripto- $AA_\beta$  telah diturunkan kepada Masalah Logaritma Diskrit Modulo 1 yang boleh diselesaikan dengan menggunakan serangan musuh pasif.

Sebagai penyelesaian, kami menakrifkan semula struktur kekunci awam dan kekunci mengenkripsi/mengdekripsi. Kami mengajukan satu parameter sulit baharu yang memainkan peranan penting dalam pengiraan kekunci mengenkripsi/mengdekripsi. Tanpa gabungan parameter sulit yang betul, pihak musuh tidak akan dapat mengira kekunci mengenkripsi/mengdekripsi.

Masalah Logaritma Diskrit Modulo 1 bagi sistemkripto- $AA_\beta$  yang telah diperkuatkan adalah lebih susah berbanding sebelum ini. Sekarang, pihak musuh perlu mencari dua parameter sulit dan tugas ini tidak dapat dilakukan melalui serangan musuh pasif.

Seterusnya kami turut mengajukan beberapa serangan yang bertujuan untuk mendapatkan parameter-parameter sulit yang digunakan dalam pengiraan kekunci mengenkrip/mengdekrip. Serangan-serangan tersebut adalah serangan carian menyeluruh terhadap parameter-parameter sulit dan serangan persamaan Diofantus linear. Kami menunjukkan bahawa serangan-serangan ini gagal untuk mendapatkan parameter-parameter sulit yang betul secara cekap.

Akhirnya kami menakrifkan semula masalah bermatematik payah bagi sistemkripto- $AA_\beta$  yang telah diperkuatkan. Untuk memecahkan keselamatan sistemkripto- $AA_\beta$  yang telah diperkuatkan, seseorang perlu mencari kekunci peribadi. Dengan memilih saiz kekunci peribadi yang cukup besar, mendedahkan kekunci peribadi melalui serangan carian menyeluruh adalah tidak dapat terlaksana secara pengiraan. Maka, sistemkripto- $AA_\beta$  adalah berpotensi untuk menjadi suatu sistemkripto yang selamat.

## ACKNOWLEDGEMENTS

First and foremost, all praise to the almighty ALLAH S.W.T for His blessings and merciful those enable me to enrich my knowledge.

I am sincerely grateful to my supervisor, Dr. Muhammad Rezal Kamel Ariffin, for his patience and kindness for supervising me and his willingness to share his knowledge. Sincere appreciation to my co-supervisors, Assoc. Prof. Dr. Mohd. Rushdan Md. Said and Assoc. Prof. Dr. Azmi Jaafar for giving advice on my research.

To my lovely wife Mrs. Che Haziqah Che Hussin and my dearest son Muhammad Danish Darwish, a lot of thanks and love for giving me soul, energy and moral boost to complete this journey. To my parents, family, lecturers, Prof. Dr. Mohd. Harun Abdullah and Assoc. Prof. Dr. Jumat Sulaiman, thank you very much for giving continuous moral support. Also to my friends especially Zahari Mahad, Mrs. Aniza Abd. Ghani and Mohd. Azlan Daud, thanks for supporting me along this journey.

I want to thank Universiti Putra Malaysia especially Institute for Mathematical Research for providing good research environment. Last but not least, a lot of appreciation to Universiti Malaysia Sabah and Ministry of Higher Education (MOHE) Malaysia for encouragement and financial support.

Thanks for this amazing journey. May Allah S.W.T blessing all of you. Wassalam.

I certify that an Examination Committee has met on **07 April 2011** to conduct the final examination of Arif bin Mandangan on his thesis entitled “**Cryptanalysis on the El-Gamal  $AA_\beta$  cryptosystem**” in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The Committee recommends that the student be awarded the Master of Science.

Members of the Examination Committee were as follows:

**Siti Hasana Sapar, PhD**

Faculty of Science  
Universiti Putra Malaysia  
(Chairperson)

**Zanariah Abdul Majid, PhD**

Faculty of Science  
Universiti Putra Malaysia  
(Internal Examiner)

**Eddie Shahril Ismail, PhD**

Faculty of Science and Technology  
Universiti Kebangsaan Malaysia  
(External Examiner)

**Hailiza Kamarul Haili, PhD**

Associate Professor  
School of Mathematical Sciences  
Universiti Sains Malaysia  
(External Examiner)
