**CHARACTERIZATION OF VIRGIN COCONUT OIL AND MULTIPLE
INSTRUMENT APPROACH FOR THE DETECTION OF LARD
ADULTERATION IN MODEL VIRGIN COCONUT OIL**

By

TENGKU SALWANI BINTI TENGKU MANSOR

**Thesis Submitted to the School of Graduate Studies, Universiti Putra Malaysia,
in Fulfilment of the Requirements for the Degree of Master of Science**

November 2011

DEDICATION

I dedicate this thesis to the 4 pillars of my life:

- 1) Mighty God Allah, who is always there to listen to my prayers
- 2) My beloved husband, Dr Ahmad Syukri Jamaludin for all your patience and
love through sunshine and rain
- 3) My beautiful son, Ahmad Suhayl for the joy you bring
- 4) My parents and parents in laws for your unrelenting support

Thank you very much for everything

Abstract of thesis presented to the Senate of Universiti Putra Malaysia in
fulfilment of the requirement for the degree of Masters of Science

**CHARACTERIZATION OF VIRGIN COCONUT OIL AND MULTIPLE
INSTRUMENT APPROACH FOR THE DETECTION OF LARD
ADULTERATION IN MODEL VIRGIN COCONUT OIL**

Institute: Halal Products Research Institute

The driving force for adulteration is to cut cost and to increase profit. However, in the case of adulteration using animal oils, this would also affect in terms of consumers beliefs and practice such as for Hindus, vegans and vegetarians, Jews and Muslims. For Muslims, adulteration using lard (LD) or improperly slaughtered animal oils is of significant issue. Detecting adulteration in fats and oils especially the high-value oils such as virgin coconut oil (VCO) is indeed needed. The attempt to find the most effective, simple, chemical-free and straightforward analysis without compromising the sensitivity and specificity is essential. Therefore, the overall objective of this study is to apply these three instruments, namely differential scanning calorimeter (DSC), electronic nose/ fast gas-chromatography (fast GC) and Fourier transform infrared (FTIR) spectroscopy to detect LD adulterations in VCO. VCO is prepared through the 'wet' and 'dry' methods, while LD was rendered from adipose tissue of pig using microwave oven. In the first phase, the VCO samples were characterized and analyzed physicochemically. The results showed that in general all VCO samples conformed to the Asian and Pacific Coconut Community

(APCC, 2003) and does not differ strikingly from each other. Subsequently, samples of VCO and LD were mixed in different concentration (v/v). Each sample admixtures were subjected to analysis of fast GC, FTIR and DSC. Some chemical analyses were performed such as iodine value (IV) and peroxide value (PV). In addition, fatty acid (FA) and triacylglycerol (TAG) analyses were also conducted using gas chromatography-flame ionization detector (GC-FID) and high performance liquid chromatography (HPLC), respectively, as the control experiments. Simple linear regression on fast GC data demonstrated that three peaks on the fast GC chromatogram were found to fit the second order polynomial curve with R^2 of 0.8121, 0.8349 and 0.9344, respectively. Partial least square (PLS) from FTIR spectroscopy was able to predict LD adulteration in VCO with the equation $y = 0.999x + 0.006$. Meanwhile, DSC showed that $T_e A$ (endset peak A) in the endothermic curve and $T_r D$ (temperature range for peak D) in the exothermic curve were found to have good predictor ability in determining percentage LD adulteration in VCO with the equation from step 2 of stepwise multiple linear regression (SMLR); % LD adulteration = $293.1 - 11.36 (T_e A) - 2.17 (T_r D)$ and R^2 adjusted of 95.82. To conclude, all three techniques were able to detect LD in VCO with ease and without the use of chemicals.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia

Pendorong utama terhadap pencemaran dalam makanan adalah untuk mengurangkan kos dan meningkatkan keuntungan. Namun begitu, pencemaran lemak haiwan akan menjejaskan amalan kepercayaan sesetengah penganut beragama Hindu, vegan dan 'vegetarian', penganut agama Yahudi dan juga Muslim. Bagi penganut Islam, penggunaan lemak khinzir (LK) ataupun penggunaan lemak haiwan yang tidak disembelih secara sah merupakan isu yang penting. Pengesanan pencemaran di dalam lemak dan minyak terutamanya minyak yang bernilai tinggi seperti Minyak Kelapa Dara (MKD) memang diperlukan. Percubaan untuk menemui teknik yang paling efektif, mudah dan tidak menggunakan bahan kimia tanpa mengurangkan sensitiviti dan spesifisiti adalah sangat-sangat diperlukan. Oleh itu, objektif keseluruhan kajian ini adalah untuk menggunakan Pembezaan Pengimbasan Kalorimeter (PPK), hidung elektronik/ Kromatografi-gas pantas (KG pantas) dan Pengubah Fourier Inframerah (PFIM) spektroskopi untuk mengesan kehadiran LK di dalam MKD. MKD telah disediakan melalui proses 'kering' dan 'basah', manakala

LK dihasilkan daripada ketuhar gelombang mikro. Pada fasa pertama, sampel-sampel MKD ini dianalisa sifat fizikal dan kimianya dan didapati bahawa secara keseluruhannya semua MKD yang dihasilkan adalah mengikut kriteria yang diberikan oleh Persatuan Kelapa Asian dan Pasifik (APCC, 2003) dan tidak berbeza antara satu sama lain secara keterlaluan. Sampel-sampel MKD dan LK kemudiannya dicampur dalam pelbagai kepekatan (v/v). Setiap sampel dianalisa oleh GK pantas, PFIM dan PPK. Analisis kimia juga telah dijalankan ke atas sampel-sampel ini seperti nilai iodin dan nilai peroksida. Analisis asid lemak (AL) dan triasilgliserol (TAG) juga dilakukan menggunakan kromatografi gas-pengesan pengionan nyala (KG-PPN) dan juga Kromatografi Cecair Berprestasi Tinggi (KCBT) sebagai eksperimen kawalan. Analisa Regresi Linear Mudah pada data KG pantas menunjukkan bahawa tiga puncak di kromatogram KG pantas serasi dengan lengkungan polinomial aturan kedua dengan R^2 0.8121, 0.8349 dan 0.9344. Statistik Persegi Separa Terkecil (PST) daripada PFIM juga dapat meramalkan LK di dalam MKD dengan persamaan matematik $y = 0.999x + 0.006$. Disamping itu, PPK menunjukkan bahawa $T_e A$ (suhu akhiran puncak A) dan $T_r D$ (perbezaan suhu puncak D) pada keluk eksoterma dapat mengesan peratus LK di dalam MKD dengan persamaan matematik daripada langkah kedua statistik Regresi Linear Berbilang Langkah (RLBL); yakni % percampuran LK = $293.1 - 11.36 (T_e A) - 2.17 (T_r D)$ dan penyesuaian $R^2 = 95.82$. Sebagai kesimpulan, ketiga-tiga teknik ini berjaya untuk mengesan kehadiran LK di dalam MKD dengan mudah dan tanpa menggunakan bahan kimia.

ACKNOWLEDGEMENTS

I would like to express my deepest appreciations and immense thanks to my Supervisor, Professor Dato' Dr Yaakob Bin Che Man, whose support and guidance from the initial phase till the end has enabled me to learn something new and valuable, as well as giving me insight to the understanding of the subject.

I am also greatly indebt to my Co-Supervisor, Associate Prof Dr Shuhaimi Mustafa for his unremitting assistance, considerations and thoughtfulness towards myself.

Special thank to my colleagues especially Abdul Rohman for sharing your knowledge and expertise with me. Same goes to Nasyrah, Aisyah, Akasyah, Sarafhana, Wan Farizan, Yanti, Aina, Nina, Azira, Irmie, Hanif, Shariena, Nadiha, Wan, Farihah, Ilyia, Dr Zuledham, Hazim and Ali, who would always be mentors to me and for being there with me, be it rain or sunshine.

Lastly, I greatly appreciate Universiti Putra Malaysia for providing the funds for the study and to give me the chance to study here.

Thank you all.

I certify that a Thesis Examination Committee has met on 29th November 2011 to conduct the final examination of Tengku Salwani Binti Tengku Mansor on her thesis entitled “Characterization of Virgin Coconut Oil and Multiple Instrument Approach for the Detection of Lard Adulteration in Model Virgin Coconut Oil” in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The Committee recommends that the student be awarded the Masters of Science degree.

Members of the Thesis Examination Committee were as follows:

Azis Ariffin, PhD

Associate Professor
Faculty of Food Science and Technology
Universiti Putra Malaysia
(Chairman)

Amin Ismail, PhD

Professor
Faculty of Medicine and Health Sciences
Universiti Putra Malaysia
(Internal Examiner)

Tan Chin Ping, PhD

Associate Professor
Faculty of Food Science and Technology
Universiti Putra Malaysia
(Internal Examiner)

Bahrudin Saad, PhD

Professor
School of Chemical Sciences
Universiti Sains Malaysia
11800, Minden, Pulau Pinang
Malaysia
(External Examiner)

SEOW HENG FONG, PhD

Professor and Deputy Dean
School of Graduate Studies
Universiti Putra Malaysia

Date:

This thesis was submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfillment of the requirement for the degree of **Masters of Science**. The members of the Supervisory Committee were as follows:

Yaakob Bin Che Man, PhD

Professor

Halal Products Research Institute

Universiti Putra Malaysia

(Chairman)

Shuhaimi Bin Mustafa, PhD

Associate Professor

Halal Products Research Institute

Universiti Putra Malaysia

(Member)

BUJANG BIN KIM HUAT, PhD

Professor and Dean
