Chairman: Lee Lai Soon, PhD

Faculty: Institute for Mathematical Research

In this study, a Tower Building (TB) heuristic with less complexity, inspired by the stack building heuristic, is proposed to hybridize with an Ant Colony Optimization (ACO) for solving the Container Loading Problem (CLP). This approach is called, the Hybrid Ant Colony Optimization with Tower Building Heuristic (HACO). The aim of the CLP is to pack a subset of given three-dimensional rectangular boxes of different sizes into a three-dimensional rectangular container of fixed dimensions in order to achieve optimal space utilization. The TB heuristic placed the base box on the container floor and packed the boxes on the base box by stacking them one by one until the container is full, whereas other researchers used the stack building heuristic to generate a set of box towers from all of the given boxes then only arranged them into the container. The HACO is applied with its probabilistic decision rule and pheromone feedback, together with the TB heuristic to construct towers of boxes to be arranged into the container in order to find the optimal solution. The pheromone evaporation will reduce the chances of the other ants selecting the same solution and consequently the search will be diversified. Preliminary

computational experiments were conducted on a subset of benchmark data sets as to find the appropriate parameters setting for the developed HACO. The proposed algorithm is tested on two standard benchmark data sets to evaluate the performance and to determine the effectiveness of the algorithm. The results in space utilization obtained were comparable with other heuristic and metaheuristic approaches from the literature. It was showed that the proposed HACO algorithm has the capability in solving the CLP.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai
memenuhi keperluan untuk ijazah Master Sains

**HIBRID ALGORITMA PENGOPTIMUMAN KOLONI SEMUT
UNTUK MASALAH MUATAN KONTENA**

Dalam kajian ini, heuristik pembinaan menara (TB) yang kurang kompleks dan diinspirasikan oleh heuristik pembinaan timbunan telah dicadangkan untuk dihibridkan dengan pengoptimuman koloni semut (ACO) bagi menyelesaikan masalah muatan kontena (CLP). Pendekatan ini dinamakan hibrid pengoptimuman koloni semut dengan heuristik pembinaan menara (HACO). CLP bertujuan untuk mengisikan subset kotak segiempat tiga dimensi yang diberikan dan berlainan saiz ke dalam satu kontena segiempat tiga dimensi yang ditetapkan saiz untuk mencapai penggunaan ruang yang optimum. Heuristik TB meletakkan kotak asas di atas lantai kontena dan menyusunkan kotak-kotak satu demi satu di atas kotak asas sehingga kontena penuh, sedangkan penyelidik lain menggunakan heuristik pembinaan timbunan untuk membina satu set menara kotak-kotak dari semua kotak yang diberikan barulah mengaturkan mereka ke dalam kontena. HACO diaplikasikan dengan keputusan peraturan kebarangkalian dan feromon maklum balas, bersama dengan heuristik TB untuk membina menara kotak-kotak bagi disusun ke dalam kontena untuk mencari penyelesaian optimum. Penyejatan feromon akan

mengurangkan peluang semut lain memilih penyelesaian yang sama dan carian akan dipelbagaikan. Eksperimen komputasi awal telah dijalankan ke atas subset penanda aras set data untuk mencari parameter yang sesuai untuk HACO. Algoritma yang dicadangkan akan diuji dengan dua penanda aras set data yang piawai untuk menilai prestasi dan menentukan keberkesanannya. Keputusan penggunaan ruang yang diperolehi adalah setanding dengan heuristik dan metaheuristik yang lain dalam literatur. HACO telah menunjukkan mempunyai keupayaan untuk menyelesaikan CLP.

ACKNOWLEDGEMENTS

Firstly, I would like to sincerely express my gratitude to my supervisor, Assoc. Prof. Dr. Lee Lai Soon, for his guidance, valuable advice, assistance, encouragement and patience that had given to me along the study and the completion of this thesis. I also want to thank the Ministry of Higher Education, Malaysia, Fundamental Research Grant Scheme (FRGS) for funding this research under grant number of 01-04-10-886FR.

Furthermore, I want to express my grateful to the supervisory committee members, Prof. Dr. Habshah Midi and Assoc. Prof. Dr. Zanariah Abdul Majid for their assistance.

Last but not least, I would like to thank my beloved parents, family and friends for their love, faith, support and encouragement.

Without all of them, I could never complete my research study which is really a difficult task to me. Really appreciate and thanks.

I certify that a Thesis Examination Committee has met on 18 October 2012 to conduct the final examination of Yap Ching Nei on her thesis entitled “Hybrid Ant Colony Optimization Algorithm for Container Loading Problem” in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The Committee recommends that the student be awarded the Master of Science.

Members of the Thesis Examination Committee were as follows:

Mahendran A/L S.Shitan, PhD

Associate Professor

Faculty of Science

Universiti Putra Malaysia

(Chairman)

Norihan binti Md Arifin, PhD

Associate Professor

Faculty of Science
