Thesis Submitted to the School of Graduate Studies, Universiti
Putra Malaysia in Fulfilment of the Requirements for the Degree of
Doctor of Philosophy

February 2012

*To whom I owe them the prosperity of my life, who exert their precious effort
to make my life successful:
My father, my mother and my wife.*

Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfillment of the requirement for the degree of Doctor of Philosophy.

**RESOURCE MANAGEMENT ALGORITHMS FOR
WAVELENGTH DIVISION MULTIPLEXING OPTICAL METRO
SLOTTED RING NETWORKS**

By

FUAAD HASAN MOHAMMED ABDULRAZZAK

February 2012

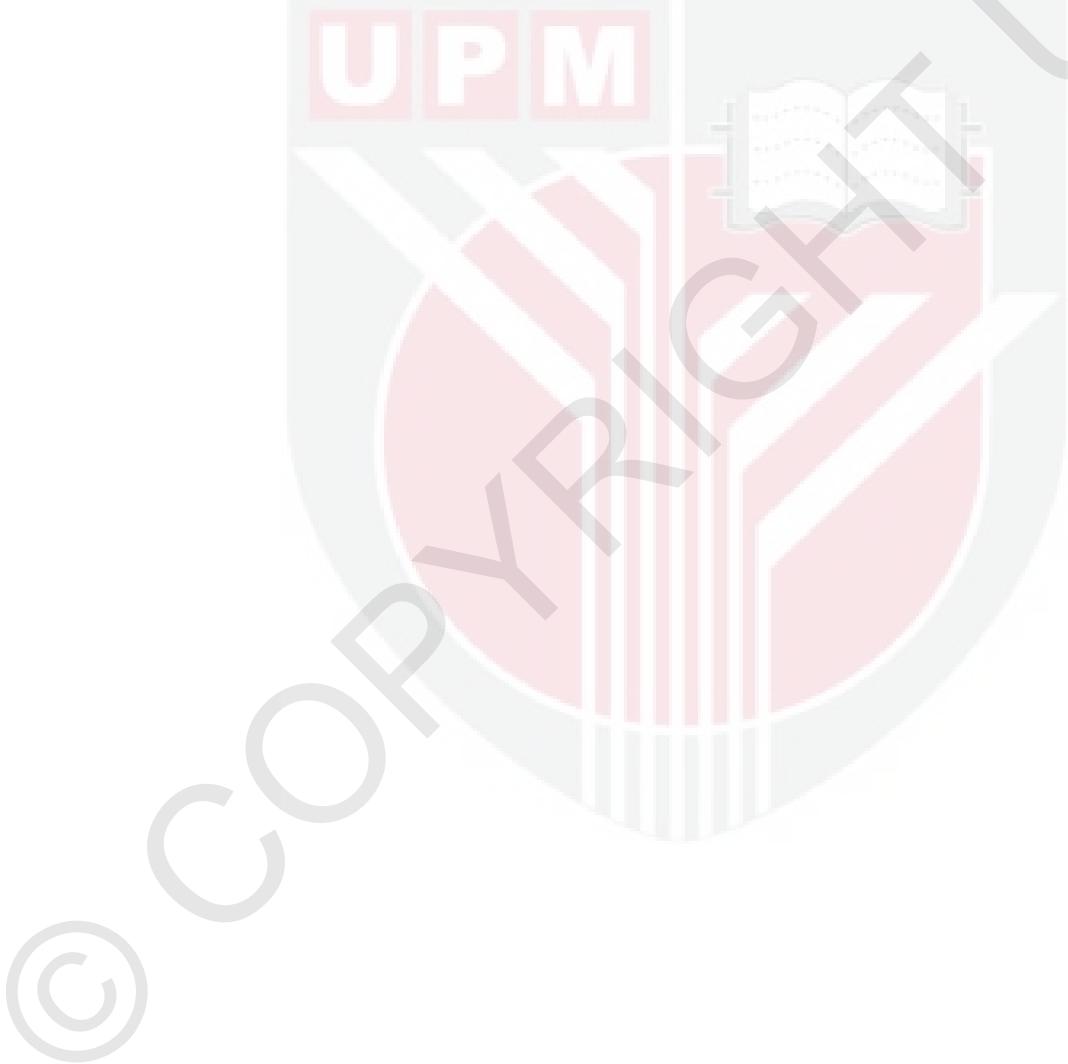

Chair: Assoc. Prof. Shamala Subramaniam, PhD

Faculty: Computer Science and Information Technology

The performance of the optical packet ring is highly dependent on the method of resource sharing deployed. In addition, the increase in demand of bandwidth by web applications relying on multicasting has made optical fibers a preferred solution. Therefore, fair sharing with collision avoidance have to be ensured when MAC protocols are designed. The most promising technology for the optical network development is the optical packet switched (OPS) WDM networks designed for the Metropolitan Area Networks (MANs). In addition, Hybrid Optoelectronic Ring NETwork (HORNET) and High-performance Optical-Packet-Switched Metro Area Network (HOPSMAN) ring architectures, have been studied as a next generation platform for MANs in this research. These architectures employ a separate wavelength as the control information channel. This control information enables the nodes to monitor their access to the transmission media. Each node is equipped with a tuneable transmitter and fixed/tuneable receiver for the purpose of data communication. Access nodes

are equipped with a fixed transmitter and fixed receiver for the control information exchange. In this research, the management of the shared network resources has been researched extensively with the intention to enhance the performance of the network and overcome the MAC protocols related limitations. Among the pertinent issues addressed are the network under utilized resources, the best-than-average access for the upstream nodes in the network, the existence of misbehaving nodes and the partiality towards homogeneous traffic. Buffers and network bandwidth are the main resources analysed, where their consumptions have been enhanced in the aim of ensuring fairness and QoS support. This research presents novel algorithms to enhance the performance of the Wavelength Division Multiplexing (WDM) dual ring network. The proposed Enhanced Virtual Output Queues Management (EVOQM) algorithm provides an elevated fairness for unicast and multicast data in the network. In addition, it is able to provide provision which are extended for QoS support. The Dynamic Based Bandwidth Reservation (DBBR) algorithm is designed to ensure that fair bandwidth access for both upstream and downstream nodes are achieved. The proposed DBBR aims also to prevent misbehaving (i.e. malicious) nodes from affecting the network performance. The third proposed algorithm which is the Dynamic Scaling Bandwidth Reservation (DSBR) has been proposed to enhance the bandwidth utilization in HOPSMAN slotted WDM ring architecture. HOPSMAN considers a minimum of at least one node as a server node in unidirectional ring HORNET architecture with tuneable receiver at each node in the network. This proposed algorithm optimizes a collaborative resource management strategy with traffic heterogeneity to enhance the utilization of network resources and ensures the requested QoS pre-requisites are guaranteed. The realization of these strategies have been achieved and

displayed by the reduction of packet loss (i.e. maximizing the total value of transferred packets) in the network. Thus, leading to the improvement of the throughput while adhering to the delay pre-requisites. The performance evaluation of the proposed algorithms has been done through a detailed and extensive discrete-event-simulation analysis. Metrics of network throughput, packet loss and delay measures, have been the main basis for the acquired results.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Doktor Falsafah

**ALGORITMA PENGURUSAN SUMBER UNTUK RANGKAIAN
PANJANG GELOMBANG PEMULTIPLEKSAN OPTIKAL
METRO SLOT CINCIN**

Oleh

FUAAD HASAN MOHAMMED ABDULRAZZAK

Pengerusi: Assoc. Prof. Shamala Subramaniam, PhD

Fakulti: Sains Komputer dan Teknologi Maklumat

Prestasi cincin paket optik amat bergantung kepada kaedah perkongsian sumber yang digunakan. Di samping itu, peningkatan jumlah permintaan untuk sumber jalur lebar oleh aplikasi web yang bergantung kepada multicasting telah membuat gentian optik sebagai salah satu kaedah penyelesaian yang terpilih. Oleh itu, perkongsian yang adil serta yang mengelakkan perlanggaran perlu dipastikan dalam proses merekabentuk protokol pencapaian media. Suis Gentian Optik (OPS) Pemultipleksan Pembahagi Panjang Gelombang (WDM) merupakan di antara pilihan utama rangkaian yang direka untuk Rangkaian Kawasan Metropolitan (MAN). Di samping itu, HORNET dan cincin seni bina HOPSMAN, telah dikaji dalam penyelidikan ini sebagai platform generasi akan datang untuk MAN. Seni bina tersebut menggunakan panjang gelombang yang berasingan sebagai saluran maklumat kawalan. Maklumat kawalan ini membolehkan nod untuk memantau akses mereka kepada media penghantaran. Setiap nod dilengkapi dengan pemancar dan penerima tuneable tetap

/ tuneable untuk tujuan komunikasi data. Nod akses dilengkapi dengan pemancar tetap dan penerima tetap bagi pertukaran maklumat kawalan. Dalam penyelidikan ini, pengurusan sumber-sumber rangkaian yang dikongsi telah dikaji secara meluas dengan niat untuk meningkatkan prestasi rangkaian dan mengatasi batasan protokol MAC. Antara isu terpenting yang perlu ditangani adalah penggunaan sumber rangkaian yang tidak digunakan , akses yang terbaik berbanding dengan purata bagi nod huluan dalam rangkaian, kewujudan nod berkelakuan tidak senonoh dan pengurusan yang berat sebelah ke arah lalu lintas homogen. Baris gilir dan jalur lebar rangkaian adalah sumber utama yang dianalisis, di mana penggunaan sumber tersebut telah dipertingkatkan dengan tujuan untuk memastikan keadilan dan sokongan QoS. Kajian ini membentangkan dua algoritma novel untuk meningkatkan prestasi rangkaian cincin WDM . Algoritma yang dicadangkan iaitu Pengurusan Baris gilir Maya yang ditingkatkan (EVOQM) memastikan pengurusan yang adil untuk data unicast dan multicast dalam rangkaian. Selain itu, ia dapat menyediakan peruntukan yang diperlukan bagi menyokong QoS. Skema Bandwidth Dinamik Berdasarkan Tempahan (DBBR) telah direka untuk memastikan akses jalur lebar yang adil bagi kedua-dua nod huluan dan hiliran. Algoritma yang dicadangkan bertujuan adalah juga untuk mencegah kelakuan yang tidak senonoh yang dilakuoleh sesebuah nod. Algoritma ketiga yang dicadangkan adalah Scaling Dynamic Bandwidth Reservation (DSBR) dan digunakan untukkan meningkatkan penggunaan jalur lebar dalam senibina cincin slotted HOPSMAN WDM. HOPSMAN menganggap sekurang-kurangnya satu nod adalah pelayan dalam senibina cincin satu arah Hornet dengan penerima tuneable di setiap nod dalam rangkaian. Algoritma yang dicadangkan mengoptimumkan sumber melalui kerjasama strategi pengurusan dengan kepelbagaiannya trafik un-

tuk meningkatkan penggunaan sumber rangkaian serta memastikan pra-syarat permintaan QoS dijamin. Pencapaian strategi ini telah dicapai dan dibuktikan melalui pengurangan kehilangan paket (iaitu memaksimumkan jumlah nilai yang diperolehi oleh paket yang dipindahkan) dalam rangkaian. Justeru, mendapatkan peningkatan prestasi di samping mematuhi prasyarat kelambatan. Penilaian prestasi algoritma yang dicadangkan telah dilakukan secara terperinci dan meluas melalui simulasi diskret-acara. Metrik daya pemprosesan rangkaian, kehilangan paket dan pengukuran kelambatan telah menjadi asas utama bagi keputusan yang diperolehi.

ACKNOWLEDGEMENTS

Praise be to Allah, lord of the world, who deserves praise and commendation for the blessing and guidance. Peace and blessings be upon the greatest human teacher, Mohammed bin Abdullah.

First and foremost I offer my sincerest gratitude, appreciation and thanks to my supervisor, Assoc. Prof. Dr. Shamala Subramaniam, who has supported me throughout my study and research with her patience, motivation, enthusiasm, and immense knowledge. I attribute the level of my PhD degree to her encouragement and effort and without her, this thesis would not have been accomplished. One simply could not wish for a better or friendlier supervisor. Similarly, I would like to express my deepest gratitude to Professor Dr. Mohamed Bin Othman, the Deputy Dean of the Faculty of Computer Science, UPM and to Assoc. Prof. Dr. Zuriati Zukarnain, for their excellent guidance, advice, caring, patience, and insightful comments. I also owe my loving thanks to my parents, wife and sons who sacrifice too much during my study. Without their prayers, encouragement, understanding and unlimited support it would have been impossible for me to finish this work. My special gratitude is due to my brothers and sisters for their loving support. I wish to extend my warmest thanks to all my friends in Yemen and in Malaysia who have supported and encouraged me in my study. Special thanks to the Chancellor of Thamar University Prof. Dr. Ahmed Alhadrani, the former Vice Chancellor of Thamar University Prof. Dr. Ahmed Abdu Saleh, Ahmed Alshibami, Ibrahim Alrajawy, Rasheed Almaqtaary, Najib Adderume, Ahmed Alahsab, Ahmed Alshalabi and Maher Alsanabani for their support and encouragement. I also gratefully acknowledged the financial support of Thamar University in Yemen.

I certify that a Thesis Examination Committee has met on 3 February 2012 to conduct the final examination of Fuaad Hasan Mohammed Abdulrazzak on his thesis entitled "Resource Management Algorithms For Wavelength Division Multiplexing Optical Metro Slotted Ring Networks" in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The Committee recommends that the student be awarded the Doctor of Philosophy.

Member of the Thesis Examination Committee were as follows:

Hamidah binti Ibrahim, PhD

Associate Professor

Faculty of Computer Science and Information Technology
University Putra Malaysia

(Chairman)

Azizol bin Hj Abdullah, PhD

Senior Lecturer

Faculty of Computer Science and Information Technology
University Putra Malaysia
(Internal Examiner)

Rohaya binti Latip, PhD

Senior Lecturer

Faculty of Computer Science and Information Technology
University Putra Malaysia
(Internal Examiner)

Mike Wood ward, PhD

Professor

University of Bradford
United Kingdom
(External Examiner)

SEOW HENG FONG, PhD

Professor and Deputy Dean
