

Parasites of *Pieris rapae* L. in south-eastern Queensland

ABSTRACT

In spring, the principal parasites of *Pieris rapae* were *Apanteles glomeratus* for the larvae, and *Pteromalus puparum*, *Brachymeria regina* and *Compsilura concinnata* for the pupae. The highest level of parasitism by *A. glomeratus* was 67%, and the highest pupal parasitism was approximately 63% by *P. puparum*
