

**NUTRITIVE VALUE IMPROVEMENT AND UTILIZATION OF RICE  
STRAW IN A TOTAL MIXED RATION FOR LAMBS**

**By**

**MD. MAINUL HASAN**

**Thesis Submitted to the School of Graduate Studies, Universiti Putra Malaysia,  
in Fulfilment of the Requirements for the Degree of Doctor of Philosophy**

**May 2006**

## **DEDICATION**

This thesis is dedicated to my parents, beloved family members, and friends for their continuous encouragement and inspiration.

Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfilment  
of the requirements for the degree of Doctor of Philosophy

**NUTRITIVE VALUE IMPROVEMENT AND UTILIZATION OF RICE  
STRAW IN A TOTAL MIXED RATION FOR LAMBS**

By

**MD. MAINUL HASAN**

**May 2006**

**Chairman: Associate Professor Mohd Ridzwan Abd. Halim, PhD**

**Faculty: Agriculture**

In the nutritional assessment study - two popular rice varieties in Malaysia namely, MR 185 and MR 219 were examined. Significant variations in straw nutritional composition were observed between plant fractions of rice varieties. Variations were also observed between the cut and stubble fraction of rice plants. The leaves of cut fraction for MR 185 straw variety showed higher nutritive quality, in terms of crude protein concentration (6.8%), fiber (ADF 46.8% and NDF 69.5%), total digestible nutrients (50.4%) and digestible energy (2.2 MJ/kg) compared to the stubble and uncut plant parts. Therefore, cut fraction of straw was recommended to be collected for ruminant feed and the stubble could be incorporated into the soil to maintain land productivity for the next crop or other purpose.

In another experiment, changes of protein and fiber concentration of rice straw were observed over time. Rice straw was exposed to open weather in the field for 30 days. Nutritive values of rice straw were found to be relatively stable when they were

exposed to the weather. There was no significant reduction of CP concentration but fiber concentration increased with delaying straw collection from the field. Therefore, farmers could delay straw collection from the field but earlier collection of straw was suggested for feeding ruminants.

In the nutritive value improvement study - two straw treatment (urea and steam) methods of rice straw were evaluated. Urea increased CP concentration of treated rice straw by 47% compared to untreated rice straw. *In vitro* DM and OM digestibility of urea treated rice straw was increased by 29.3% and 35.9%, respectively compared to the untreated rice straw. This was confirmed by the *in vitro* gas production at a sequential incubation with buffered rumen fluid. Potential gas volume was higher in urea treated rice straw (52.2 ml/200mg) than untreated rice straw (41.9 ml/200mg) and steam treated rice straw (50.9 ml/200mg). Steam treatment caused a significant decrease in lignin (ADL) concentration (30.3%) compared to urea treated rice straw (34.1%) and untreated rice straw (35.0%) due to the effect of high pressure and rapid decompression to weaken the cell wall structure and the release of fermentable sugar from the depolymerized lignin and cell wall matrix. The disruptions and the physical changes in rice straw cell wall structure due to steam treatment enable microbes to penetrate to the cell wall matrix resulting in improved digestibility.

In the feed evaluation study – iso-nitrogenous and iso-caloric various formulation of total mixed ration was examined. Three straw treatments (untreated, urea and steam treated) and three levels (40, 55 and 70%) of straw inclusion were used together with other ingredients to make total mixed ration.

In a feeding trial, dry matter intake of the ration and average daily gain of the Malin local-bred lambs was examined. The ration comprising 40% steam treated straw showed highest intake ( $126.5 \text{ g kg}^{-1}\text{W}^{0.75}$ ) and gave highest daily gain ( $176.8 \text{ g d}^{-1}$ ). Untreated straw with 70% inclusion showed lowest intake ( $71.7 \text{ g kg}^{-1}\text{W}^{0.75}$ ) and gave the lowest weight gain ( $50.0 \text{ g d}^{-1}$ ). Steam treated ration increased intake by 27.4% and urea treated ration by 21.5%; average daily gain of the lambs increased by 73.5% in steam and 65.0% in urea treated ration compared to untreated ration. Increasing level of straw inclusion from 40 to 70% reduced intake by 21.1% and weight gain by 38.8%.

In the digestibility study, there were no significant differences ( $P>0.05$ ) in nutritional quality among the rations. No significant differences were also obtained in rate of particulate particle constant, mean retention time and solid flow rate. However, increasing level of straw inclusion tended to increase retention time due to the slower passage rate. Therefore, this study concluded that the rice straw has a potential to be utilized in ruminant feeding system by using straw treatment and improving its nutritive value with the addition of other ingredients. Hence, production of TMR is worth trying and this could conceivably be practiced by large farms for intensive ruminant production.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Doktor Falsafah

**PEMBAIKAN NILAI PEMAKANAN DAN KEGUNAAN JERAMI PADI  
DALAM RANGSUM CAMPURAN LENGKAP UNTUK KAMBING BIRI-  
BIRI**

Oleh

**MD. MAINUL HASAN**

**Mei 2006**

**Pengerusi:** Profesor Madya Mohd Ridzwan Abd. Halim, PhD

**Fakulti:** Pertanian

Di dalam kajian nilai pemakanan – dua varieti padi yang popular di Malaysia iaitu, MR 185 dan MR 219 diuji. Variasi yang bererti di dalam kandungan nilai pemakanan telah diperhatikan diantara pecahan bahagian-bahagian tumbuhan kedua-dua varieti padi. Variasi juga diperhatikan antara bahagian tanaman padi lain yang dipotong dan bahagian batang padi. Bahagian daun yang dipotong bagi jerami padi varieti MR 185 menunjukkan kualiti pemakanan yang paling tinggi iaitu, kepekatan protein kasar (6.8%), serat (ADF 46.8% dan NDF 69.5%), jumlah nutrien boleh-hadam (50.4%) dan tenaga boleh-hadam (2.2 MJ/kg) berbanding batang padi dan bahagian tanaman yang tidak dipotong. Oleh itu, jerami padi daripada bahagian tanaman yang dipotong adalah disyorkan untuk dijadikan makanan haiwan ruminan dan bahagian batang padi pula boleh dicampur/digaul ke dalam tanah untuk mengekalkan produktiviti bagi tanaman selepasnya atau bagi tujuan lain.

Di dalam eksperimen yang lain pula perubahan kepekatan protein dan serat bagi jerami padi ini diperhatikan dari masa ke semasa. Jerami padi didedahkan kepada cuaca di padang selama 30 hari. Kualiti pemakanan jerami padi ini didapati agak stabil apabila ia didedahkan kepada cuaca. Langsung tiada kemerosotan CP kasar yang jelas berlaku tetapi kepekatan serat bertambah seiring dengan masa atau berkadar terus dengan masa. Dengan ini, petani boleh melewatkkan pengumpulan / kutipan jerami daripada ladang tersebut tetapi pengumpulan yang lebih awal disyorkan jika jerami tersebut digunakan untuk makanan ruminan.

Di dalam kajian lanjutan nilai pemakanan – dua rawatan jerami iaitu kaedah urea dan stim telah dijalankan dan dinilai. Urea meningkatkan kepekatan CP jerami padi sebanyak 47% dibandingkan dengan jerami padi yang tidak dirawat. *In vitro* bagi bahan kering (DM) dan bahan organik (OM) boleh hadam bagi jerami padi yang dirawat oleh urea meningkat sebanyak 29.3% dan 35.9%, masing-masing berbanding jerami padi yang tidak dirawat. Ini dibuktikan oleh pengeluaran gas *in vitro* pada turutau inkubasi/pengeraman dengan penampang cecair rumen. Keupayaan pengeluaran isipadu gas paling tinggi diperolehi daripada jerami padi yang dirawat dengan urea (52.2 ml/200mg) berbanding jerami yang tidak dirawat (41.9 ml/200mg) dan jerami yang dirawat dengan stim (50.9 ml/200mg) disebabkan oleh kadar malar bererti yang lebih tinggi untuk pengeluaran gas telah diperolehi dengan jerami yang diberi rawatan berbanding dengan tanpa rawatan dan rawatan stim. Rawatan stim menyebabkan peningkatan yang bererti di dalam kepekatan lignin (ADL) (30.3%) berbanding jerami yang dirawat dengan urea (34.1%) dan jerami tanpa rawatan (35.0%) disebabkan oleh kesan daripada tekanan yang tinggi dan pemampatan yang cepat untuk melemahkan struktur dinding sel dan membebaskan gula fermentasi

daripada lignin depolimerisasi dan dinding sel matriks. Gangguan dan penukaran fizikal pada dinding struktur sel jerami padi disebabkan oleh rawatan stim yang membolehkan mikrob menembusi dinding sel matriks dan menghasilkan peningkatan terhadap keboleh-hadaman. Oleh itu, jerami yang dirawat dengan stim juga berkesan dalam meningkatkan kualiti jerami padi tetapi keperluan tenaga dan kos menghadkan penggunaannya oleh petani-petani yang kekurangan sumber.

Di dalam kajian menilai pemakanan - variasi formulasi iso-nitrogenous and iso-caloric bagi rangsum campuran lengkap telah diuji. Tiga jenis rawatan (tanpa rawatan, urea dan stim) dan tiga paras (40, 55 and 70%) jerami dengan penyertaan bahan lain digunakan untuk menyediakan rangsum campuran lengkap. Dalam percubaan pemberian makanan, pengambilan bahan kering rangsum ini dan hasil purata harian bagi baka kambing tempatan Malin telah diuji. Rangsum terdiri daripada 40% jerami yang distim menunjukkan pengambilan yang paling tinggi ( $126.5 \text{ g kg}^{-1}\text{W}^{0.75}$ ) dan memberi hasil harian yang paling tinggi ( $176.8 \text{ g d}^{-1}$ ). Jerami dengan penyertaan 70% bahan lain tanpa rawatan menunjukkan pengambilan yang paling rendah ( $71.7 \text{ g kg}^{-1}\text{W}^{0.75}$ ) dan memberi hasil yang paling rendah ( $50.0 \text{ g d}^{-1}$ ). Rangsum yang dirawat dengan stim menunjukkan pengambilan yang meningkat 27.4% dan rangsum yang dirawat urea sebanyak 21.5%; hasil purata harian kambing meningkat sebanyak 73.5% bagi rangsum dengan rawatan stim dan 65.0% bagi rangsum dengan rawatan urea berbanding tanpa rawatan. Paras peningkatan bagi jerami yang dicampur dengan 40 to 70% bahan lain menurun pengambilannya sebanyak 21.1% dan hasil berat yang diperolehi ialah 38.8%.

Untuk kajian boleh-hadam tiada terdapat perbezaan yang bererti ( $P>0.05$ ) dalam kualiti pemakanannya diantara rangsum. Tiada perbezaan bererti juga diperoleh pada kadar particulate partikel tetap, min masa penahanan dan kadar aliran pejal. Walau bagaimanapun, paras peningkatan jerami campuran cenderung kepada penambahan masa penahanan disebabkan oleh kadar laluan yang perlahan. Kesimpulannya jerami padi mempunyai potensi untuk digunakan sebagai sistem pemberian makanan untuk ruminan melalui penekanan terhadap rawatan jerami dan memperbaiki nilai pemakanannya dengan penggunaan teknologi untuk meningkatkan nilai tambahnya. Lagi pula, pengeluaran TMR adalah berbaloi untuk dicuba, di mana ia mungkin boleh diamalkan oleh ladang-ladang besar untuk pengeluaran ruminan yang intensif.

## **ACKOWLEDGMENTS**

I wish to express my sincere gratitude to the chairman of my supervisory committee, Associate Professor Dr. Mohd Ridzwan Abd. Halim, Department of Crop Science, Faculty of Agriculture, Universiti Putra Malaysia, for his guidance, suggestions and encouragements. My gratitude also extended to the other members of the supervisory committee, Associate Professor Dr. Liang Juan Boo and Professor Dr. Abdul Razak Alimon, at Department of Animal Science, Faculty of Agriculture, Universiti Putra Malaysia, for their invaluable guidance, comments and suggestions on my research and manuscript of dissertation.

My sincere thanks expressed to all of my friends who have helped me in many ways in conducting the experiment. I would like to thanks to the entire staff of the Faculty of Agriculture, Universiti Putra Malaysia, for their kind cooperation in providing facilities and assistance during my study. Thanks to the staff of MARDI, Serdang to allow me to use their instrumental facilities for pelletizing the experimental ration. I am also indebted to the National Council for Scientific Research and Development, Ministry of Science and Technology, Malaysia for funding this project.

Finally, my sincere appreciation goes to my parents and beloved family members for their understanding, patience and moral support throughout my study. Thanks for sacrifice to my wife, Mamotaj Dilruba and my daughter, Maheen Mamota Hasan.

I certify that an Examination Committee has met on 9<sup>th</sup> May 2006 to conduct the final examination of Md. Mainul Hasan on his Doctor of Philosophy thesis entitled “Nutritive Value Improvement and Utilization of Rice Straw in a Total Mixed Ration for Lambs” in accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1980 and Universiti Pertanian Malaysia (Higher Degree) Regulations 1981. The Committee recommends that the candidate be awarded the relevant degree. Members of the Examination Committee are as follows:

**Idris Abdol, PhD**

Associate Professor

Faculty of Agriculture

Universiti Putra Malaysia

(Chairman)

**Halimatun Yaakub, PhD**

Associate Professor

Faculty of Agriculture

Universiti Putra Malaysia

(Internal Examiner)

**Zainal Aznam Mohd Jelan, PhD**

Professor

Faculty of Agriculture

Universiti Putra Malaysia

(Internal Examiner)

**Metha Wanapat, PhD**

Professor

Faculty of Agriculture

Khon Kaen University

(External Examiner)
