Faculty: Medicine and Health Sciences

Cannabis is classified as a halucinogen, is prepared as a bhang, ganja, hashish, and marijuana. Three putative varieties of cannabis are *Cannabis sativa*, *Cannabis indica*, and *Cannabis ruberlalis*. Delta-9-tetrahydrocannabinol (Δ^9 -THC), also known as tetrahydrocannabinol, is the main psychoactive substance derived from *Cannabis sp.*. Δ^9 -THC is used in treating pain, asthma and coughs, also acts as sedative agent.

It was known to show impairment effects on variety of central effects including producing hypothermia, antinociception and changes of locomotor activity, immediate recall, memory retrieval, and also in working and short-term memory. Δ^9 -THC was known to alter the neurogenesis and neuronal plasticity observed in animal models. However, the doses used in experiments were high and even higher in cell culture method. The purposes of this study was to observe the effects of Δ^9 -THC at lower dose on neurogenesis and neuronal plasticity involving nociception and cognitive performances in acute (7 days) and chronic (21 days) treatments on

Sprague dawley rats. Three doses of Δ^9 -THC were used; 0.75, 1.5 and 3.0 mg/kg, and 0.9% normal saline with 3% ethanol was used as a control. Two types of behavioural tests were run; hot plate and novel-object discrimination (NOD) tests, for observing the nociception and cognitive performances, respectively. The brain samples were collected for further analyses with Western blot technique to determine the protein concentration of Doublecortin (DCX), *c-fos*, and downstream regulatory element modulator (DREAM) as a marker for cognitive and nociception, respectively. The brain was also investigated using immunohistochemistry (IHC) technique, in detecting the BrdU, DCX, nestin, Class III β -tubulin (TuJ-1), and glial fibrillary acidic protein (GFAP) as markers for neurogenesis. Cresyl violet stain was used for observing the neuronal cell death (NCD) present in the hippocampus of the brain. Liver and kidney were collected and further processed with hematoxylin and eosin stain in observing the toxicity effects of Δ^9 -THC. 1.5 mg/kg of Δ^9 -THC gave significant differences at $p < 0.001$ when compared to control, 0.75, and 3.0 mg/kg of Δ^9 -THC observed on the neurogenesis, cognitive function and nociceptive response. The observations were acceptable for both acute and chronic treatments, behavioural and molecularly. Meanwhile, all dosages of Δ^9 -THC showed significant differences at $p < 0.001$ as compared to control on toxicity test involving brain after giving stress. In studying the effect on liver and kidney, all dosages of Δ^9 -THC and control showed no significant difference at $p > 0.05$. From these results, it can be concluded that 1.5 mg/kg of Δ^9 -THC improved the level of neurogenesis and neuronal plasticity when compared to control, 0.75 and 3.0 mg/kg of Δ^9 -THC. Δ^9 -THC at all dosages used was observed to give neuroprotective function against stress. Treatment of Δ^9 -THC showed no toxic effect observed in the kidney and liver.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Master Sains

**PERANAN DELTA-9-TETRAHIDROCANABINOL KE ATAS GENESIS
DAN PLASTIK NEURON**

Canabis terdorong sebagai agen halusinasi, disediakan sebagai satu bhang, ganja, dadah, dan marijuana. Tiga jenis tumbuhan cannabis ialah *Cannabis sativa*, *Cannabis indica*, dan *Cannabis ruberlalis*. Delta-9-tetrahidrocannabinol (Δ^9 -THC), juga dikenali sebagai tetrahidrocannabinol, merupakan bahan utama psikoaktif yang diperoleh daripada *Cannabis sp.* Δ^9 -THC digunakan dalam merawat kesakitan, asma dan batuk, juga bertindak sebagai agen sedatif. Ia memberikan kesan pengurangan dalam pelbagai aspek utama termasuklah mendorong hipotermia, antinosiseptif, dan perubahan pada aktiviti lokomotor, panggilan segara ingatan, pengkalan data dan juga ingatan semasa dan jangka pendek. Δ^9 -THC dapat mempengaruhi genesis and plastisiti neuron dalam model haiwan. Walau bagaimanapun, dos yang digunakan dalam kajian adalah tinggi, malah ianya lebih tinggi dalam kaedah tisu kultur. Kajian ini dijalankan untuk mengetahui kesan Δ^9 -THC menggunakan dos yang lebih rendah ke atas genesis and plastisiti neuron merangkumi aspek nosiseptif dan kognitif pada tempoh rawatan akut (7 hari) dan kronik (21 hari) ke atas tikus Sprague dawley. Tiga dos Δ^9 -THC digunakan; 0.75, 1.5, dan 3.0 mg.kg Δ^9 -THC serta 0.9% air garam

berserta 3% etanol sebagai kawalan. Dua ujian tingkahlaku dijalankan; plat panas dan diskriminasi objek-novel (NOD), untuk melihat kesan nosiseptif dan kognitif. Sampel otak diambil untuk dianalisis menggunakan teknik Western Blot bagi menentukan kepekatan protein Doublecortin (DCX), *c-fos*, dan *downstream regulatory element antagonistic modulator* (DREAM) kerana ia merupakan penanda untuk kognitif dan nosiseptif. Otak juga disiasat menggunakan teknik imunohistokimia (IHC) bagi mengesan BrdU, DCX, nestin, *Class III β-tubulin* (TuJ-1), dan *glial fibrillary acidic protein* (GFAP) sebagai penanda untuk genesis neuron. Pewarnaan Cresyl violet digunakan untuk mengenalpastikan sel neuron yang telah mati (NCD) pada hipokampus. Sampel hati dan ginjal diambil dan diproses menggunakan pewarnaan hematoxilin dan eosin bagi melihat kesan keracunan disebabkan oleh Δ^9 -THC. 1.5 mg / kg Δ^9 -THC memberi perbezaan-perbezaan yang ketara pada $p < 0.001$ apabila dibandingkan dengan kawalan, 0.75 and 3.0 mg/kg Δ^9 -THC pada fungsi genesis neuron, kognitif dan nosiseptif. Pemerhatian-pemerhatian boleh diterimapakai oleh kedua-dua rawatan akut dan kronik melalui perubahan tingkahlaku dan molekular. Sementara itu, semua dos Δ^9 -THC menunjukkan perbezaan pada $p < 0.001$ berbanding dengan kawalan dalam ujian ketoksikan melibatkan otak selepas diberikan tekanan. Dalam mengkaji kesan ke atas hati dan buah pinggang, semua dos Δ^9 -THC dan kawalan tidak menunjukkan perbezaan pada $p > 0.05$. Dari hasil ujian, disimpulkan bahawa 1.5 mg/kg Δ^9 -THC dapat meningkatkan kadar genesis dan plastisiti neuron berbanding kawalan, 0.75, and 3.0 mg/kg Δ^9 -THC. Δ^9 -THC memberi fungsi neuroprotektif terhadap stress. Rawatan Δ^9 -THC menunjukkan tiada kesan ketoksikan pada buah pinggang dan hati.

ACKNOWLEDGEMENTS

I would like to thank ALLAH S.W.T. for His blessings for me in completing this study. He gave me the chance, knowledge, and ways in finishing this project. I also want to show my gratitude to my parents and family with their continuous support for me and always stood behind me in all circumstances. I would also like to thank my supervisor and my co-supervisor, Dr. Che Norma binti Mat Taib and Dr. Mohamad Aris bin Mohd Moklas for their help and guidance along my journey. Last but not least, my endless thanks to friends and staffs of Anatomy and Histology Laboratory, Faculty of Medicine and Health Sciences, Universiti Putra Malaysia for their help and advices. I would also like to thank everyone that helped and supported me in my project, either directly or indirectly. Only Allah SWT could repay for all your kindness. Thank you.
