**DEVELOPMENT OF PROLINE-BASED CHIRAL IONIC LIQUID
ORGANOCATALYST FOR ASYMMETRIC MICHAEL REACTION
UNDER MICROWAVE IRRADIATION**

By

EMMY MARYATI OMAR

December 2013

Chairman : Professor Mohd Basyaruddin Abdul Rahman, PhD

Faculty : Science

Recent developments in organocatalysis have shown that chiral ionic liquid organocatalysts can be advantageously performed in various organic solvents and ionic liquids. Along with the good catalytic performance especially in Michael reaction, some drawbacks such as high catalyst loading, large excess of substrates and long reaction time need to be improved in the reaction processes. In this thesis, four aspects of the title objectives were studied. In the first part, eight proline derived amino acids were successfully screened for good catalytic activity and selectivity towards Michael products. L-proline amino acid has been identified as the most active organocatalyst and selective small organic molecule in the Michael reaction of aldehydes to nitrostyrenes. A high percentage yield (> 92%), moderate enantioselectivity (28% ee) and high diastereomeric ratio (90/10) were obtained using 30 mol% catalyst loading, 2 aldehyde equivalent ratio and 9 hours reaction time in isopropanol solvent at room temperature. Beside organic solvent, the uses of environmentally-friendly ionic liquids were explored. The 1-butyl-3-methylimidazolium bis(trifluoromethylsulfonyl)imide ([Bmim][NTf₂]) ionic liquid was found to be the best solvent media compared to other ten more ionic liquids. The results obtained with high percentage yield (90%), slightly increased in enantioselectivity (38% ee) and high diastereomeric ratio (91/9). In order to develop the catalytic activity, microwave irradiation technique was used to shorten the Michael reaction time. The time was successfully reduced from 8-9 hours to 5-40 min at temperature 60 °C with almost similar results as in room temperature and conventional heating conditions. The [Bmim][NTf₂] ionic liquid was reused five times, representing an economic alternative to conventional organic solvents.

The synthetic reaction was optimized by Response Surface Methodology (RSM) approach. Design of experiments based on Central Composite Design (CCD) was used to

evaluate the interactive effects of the reaction parameters including catalyst loading, substrate equivalent ratio and reaction time. By RSM optimization, a catalyst loading could be reduced from 30 to 10 mol% with high percentage yield (97%) and moderate enantioselectivity (37% ee). Large excess of aldehyde (normally 10-20 equiv ratio) that has been used in organocatalysis field was also successfully reduced to 2 equivalent ratio indicating that the RSM approach can be applied effectively to optimize the Michael reaction of aldehyde to β -nitrostyrene.

The proline-based chiral ionic liquid (CIL) organocatalysts were designed and synthesized in order to overcome some of the drawbacks by L-proline. These chiral ionic liquids contain a chiral pyrrolidine (proline-based) backbone and incorporated with ionic species. Without any additive, the reaction of CIL imidazolium (S)-pyrrolidine sulfonamide organocatalyst was found to be very effective in isopropanol at room temperature in giving excellent yields (up to 90%), shorten time constraint (3-5 hours), and high diastereoselectivities (95/5). The results also demonstrated that [Bmim][NTf₂] ionic liquid was not suitable solvent as it reduced the catalytic activity not only at room temperature but also under microwave irradiation. However, the reaction of CIL imidazolium (S)-pyrrolidine sulfonamide organocatalyst was found to be effective under microwave irradiation in isopropanol with very high yield (99%) with slightly increased in enantioselectivity (42% ee) in 10 min reaction time.

The understanding of the stereoselectivity on the mechanism catalyzed by CIL imidazolium (S)-pyrrolidine sulfonamide organocatalyst was also investigated by General Atomic and Molecular Electronic Structure System (winGAMESS) software in the last part of the thesis. This approach indicated that the N-H acidic hydrogen from the CIL imidazolium (S)-pyrrolidine sulfonamide organocatalyst plays an important role in the reaction by forming a hydrogen bond to the nitrostyrene substrate that leads to C-C bond formation by the enamine mechanism. The computational results agree quite well with the observed stereoselectivity of chiral ionic liquid organocatalyst for the Michael reaction of aldehyde to nitrostyrene.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Doktor Falsafah

**PEMBANGUNAN CECAIR IONIK KIRAL BERASASKAN SEBATIAN
PROLINA SEBAGAI PEMANGKINAN ORGANIK UNTUK TINDAKBALAS
TIDAK SIMETRI MICHAEL DI BAWAH IRADIASI GELOMBANG MIKRO**

Oleh

EMMY MARYATI OMAR

Disember 2013

Pengerusi : Professor Mohd Basyaruddin Abdul Rahman, PhD

Fakulti : Sains

Pembangunan terkini dalam bidang pemangkinan organik menunjukkan bahawa mangkin cecair ionik kiral boleh memberikan kesan yang bagus ke atas pelarut organik dan pelarut ionik. Sehubungan dengan itu, dalam tindak balas Michael, terdapat beberapa kelemahan seperti, penggunaan jumlah pemangkinan yang tinggi, kadar nisbah reaktan dan masa tindak balas yang panjang seharusnya diberikan perhatian. Oleh yang demikian, kajian yang telah dihuraikan di dalam tesis ini memfokuskan kepada empat bahagian utama. Pada bahagian pertama, lapan asid amino telah berjaya dikenal pasti. Di dalam tindak balas Micheal dari aldehida ke nitrostirena, asid amino L-prolina telah dikenalpasti sebagai molekul organik kecil yang aktif dan juga selektif. Hasil produk yang tinggi (>92%), enantioselektiviti yang sederhana (28 ee%) dan kadar diastereomerik yang tinggi (90/10) telah berjaya diperoleh menggunakan mangkin L-prolina sebanyak 30 mol%, aldehida dengan kadar 2 nisbah reaktan dalam masa tindak balas selama 9 jam dalam pelarut isopropil alkohol pada suhu bilik. Selain daripada pelarut organik, penggunaan pelarut yang dikatakan mesra alam seperti cecair ionik juga diterokai. Cecair ionik [Bmim][NTf₂] didapati sebagai pelarut media yang terbaik berbanding dengan sepuluh cecair ionik yang lain. Keputusan yang diperoleh menunjukkan peratusan hasil produk yang tinggi (90%), kenaikan enantioselektiviti (38% ee) dan juga kadar diastereometrik yang tinggi (91/9). Dalam menghasilkan aktiviti pemangkinan yang lebih efektif, teknik iradiasi gelombang mikro telah digunapakai untuk mempercepatkan masa tindakbalas Micheal. Jumlah masa berjaya dikurangkan daripada 8-9 jam kepada 5-40 minit pada suhu 60 °C. Keputusan ini sangat bertepatan dengan keputusan pada suhu bilik dan kondisi pemanasan yang konvensional. Cecair ionik [Bmim][NTf₂] telah digunakan semula sebanyak 5 kali dan boleh dijadikan sebagai salah satu media alternatif yang komersial berbanding dengan pelarut organik.

Tindak balas sintetik telah dioptimumkan melalui kaedah *Response Surface Methodology* (RSM). Rekabentuk eksperimen adalah berdasarkan kepada *Central Composite Design* (CCD) yang telah digunakan untuk menilai kesan interaktif untuk beberapa parameter termasuk jumlah pemangkin, kadar nisbah reaktan dan masa tindakbalas. Melalui keputusan hasil data RSM yang optimum, jumlah mangkin dapat dikurangkan daripada 30 kepada 10 mol% dengan peratusan hasil produk yang tinggi (97%) dan enantioselektiviti yang sederhana (37% ee). Lebihan aldehida yang tinggi (kadar nisbah reaktan normal 10-20) yang digunakan dalam bidang pemangkinan organik telah berjaya dikurangkan kepada kadar nisbah 2, menunjukkan bahawa RSM adalah kaedah yang boleh diaplikasi secara efektif untuk mengoptimumkan tindak balas Micheal aldehida ke nitrostirena.

Beberapa mangkin cecair ionik kiral (CIL) berasaskan sebatian prolina telah dibentuk dan disintesis untuk mengatasi beberapa kelemahan yang wujud oleh L-prolina. Cecair ionik kiral ini mempunyai tulang belakang kiral pirrolidina yang telah digabungkan dengan spesies ionik. Tanpa bahan tambahan, tindak balas mangkin CIL imidazol (S)-pirrolidina sulfonamida telah didapati sangat efektif dalam pelarut isopropil alkohol pada suhu bilik dengan peratusan hasil yang sangat memberangsangkan (sehingga 90%), masa yang singkat (3-5 jam) dan kadar diastereoselektif yang tinggi (95/5). Hasil kajian ini juga menunjukkan bahawa cecair ionik [Bmim][NTf₂] tidak sesuai menjadi pelarut kepada mangkin organik kerana ia mengurangkan aktiviti pemangkinan bukan hanya pada suhu bilik, tetapi juga di bawah teknik iradiasi gelombang mikro. Walaubagaimanapun, tindak balas mangkin CIL imidazol (S)-pirrolidina sulfonamida didapati memberi kesan yang efektif di bawah keadaan radiasi gelombang mikro di dalam pelarut isopropil alkohol dengan peratusan hasil produk yang sangat tinggi (99%) dengan sedikit kenaikan pada enantioselektif (42% ee) dalam masa 10 minit.

Perisian General Atomic and Molecular Electronic Structure System (winGAMESS) digunakan dalam bahagian akhir thesis bagi memahami mekanisme streoselektif. Kaedah yang digunakan ini menunjukkan bahawa ikatan hidrogen N-H yang bersifat asidik memainkan peranan penting dalam tindak balas melalui penghasilan ikatan hidrida kepada nitrostirena yang akan membawa kepada penghasilan ikatan C-C melalui mekanisme enamina. Perisian komputer juga menunjukkan keputusan streoselektif yang didapati hampir sama dengan pemerhatian sebenar oleh cecair ionik kiral untuk tindakbalas Micheal dari aldehida ke nitrostirena.

ACKNOWLEDGEMENTS

Firstly, I would like to thank my supervisor, Professor Dr. Hj. Mohd Basyaruddin, who gave me the opportunity to join his ionic liquid group as well as directed me through this research work, very supportive and always make my mind widely open. I would also like to thank his mercy considering my short research attachment with his grant. I'm really glad to be your student. Thank you so much Prof!

To my supporting research supervisors Professor Dr. Abu Bakar Salleh, Professor Dr. Mahiran Basri, Dr Ibrahim, Dr.Bimo and Dr.Emilia and my labmate 401¹, you all will always have a special place in my heart. Thank you!!! I really love you guys!!!!

Greatest thanks to Professor Dr. Allan D. Headley and Dr.Bukuo Ni who allowed me to work with their research group and having a tremendous experience at Texas A & M University-Commerce (TAMU-C). Their kindness, supportive discussion and enthusiasm for chemistry always replenished my energy to work. I really appreciated!!!

Colleagues Subrata, Zilong, Druba, Erica, Jianbin, Ben, Poornima and Kurt. Thank you for helping me with the synthesis work and making me laugh in the lab. Word can't describe my thankful and I miss all of you!!!

My lovely husband (*Azam^luv u!*), papa mama and siblings, in-laws and not forgetting my housemates (Rahimah and K.Tuty) thanks you for your patience, support and encouragement in every second. Without all, I will never be so brave.

Last but not least, I would also like to express my deepest gratitude to my scholarship NSF-MOSTI and MGI for the allowances throughout 6 months research attachment. Without their support I will never had a chance to gain an experience abroad.

Emmy Omar

I certify that a Thesis Examination Committee has met on 3rd December 2013 to conduct the final examination of Emmy Maryati Omar on her thesis entitled "Development of

¹ Azhar, Nora, Zati, Naimah, Asrul, Rizal, Peter, Ieja, Uswatun, Maha, Lim, K.syila, Malahat, Naz, Sok Han, Hanim, Casey, Fariza, Nana, Saadi, Wasiew, Mohamad, Ahmad, Dave and many more...millions thanks!!!!

Proline-based Chiral Ionic Liquid Organocatalyst for Asymmetric Michael Reaction Under Microwave Irradiation” in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The Committee recommends that the student be awarded the Doctor of Philosophy.

Members of the Thesis Examination Committee were as follows:

ABDUL HALIM BIN ABDULLAH, PhD

Assoc. Professor
Faculty of Science
University Putra Malaysia
(Chairman)

MOHD ASPOLLAH BIN MD SUKARI, PhD

Professor
Faculty of Science
University Putra Malaysia
(Internal Examiner)

TAN YEN PING, PhD

Senior Lecturer
Department of Chemistry
Faculty of Science
University Putra Malaysia
(Internal Examiner)

JOHN A. GLADYSZ, PhD

Professor
Texas A&M University-College Station
Texas, United State of America
(External Examiner)

NORITAH OMAR, PhD

Assoc. Professor and Deputy Dean
School of Graduate Studies
Universiti Putra Malaysia

Date : 19 December 2013

This thesis was submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfillment of the requirement for the degree of Doctor of Philosophy. The members of the Supervisory Committee were as follows:

Mohd Basyaruddin Abd Rahman, PhD

Professor
Faculty of Science
University Putra Malaysia
(Chairman)

Mahiran Basri, PhD

Professor
Faculty of Science

DECLARATION

Declaration by Graduate Student

I hereby confirm that:

- this thesis is my original work;
- quotations, illustrations and citations have been duly referenced;
- this thesis has not been submitted previously or concurrently for any other degree at any other institutions;
- intellectual property from the thesis and copyright of thesis are fully-owned by Universiti Putra Malaysia, as according to the Universiti Putra Malaysia (Research) Rules 2012;
- written permission must be obtained from supervisor and the office of Deputy Vice-Chancellor (Research and Innovation) before thesis is published (in the form of written, printed or in electronic form) including books, journals, modules, proceedings, popular writings, seminar papers, manuscripts, posters, reports, lecture notes, learning modules or any other materials as stated in the Universiti Putra Malaysia (Research) Rules 2012;
- there is no plagiarism or data falsification/fabrication in the thesis, and scholarly integrity is upheld as according to the Universiti Putra Malaysia (Graduate Studies) Rules 2003 (Revision 2012-2013) and the Universiti Putra Malaysia (Research) Rules 2012. The thesis has undergone plagiarism detection software.

Signature: _____ Date: 3 December 2013
