Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfilment of the requirement for the degree of Doctor of Philosophy

GENETIC POTENTIAL OF SELECTED SWEET CORN INBRED LINES AND ANALYSIS OF THEIR COMBINING ABILITY ASSISTED BY MICROSATELLITE DNA MARKERS

By

PEDRAM KASHIANI

May 2012

Chairman: Prof. Ghizan Saleh, PhD

Faculty: Agriculture

A study was conducted to evaluate the potential of sweet corn inbred lines developed from different source populations, to determine genetic diversity among those inbred lines based on agronomic performance and microsatellite DNA markers, to identify major heterotic groups among the inbred lines for selection of potential parents for hybrid production, and to evaluate combining abilities among selected parental inbred lines in a diallel cross. Performance and heterosis of the single-cross hybrids were evaluated at two different locations, Serdang and Sepang. Genetic distances among the inbred lines revealed by the microsatellite markers were used to predict hybrid performance.

Thirteen selected sweet corn inbred lines adapted to the tropical environment were evaluated for their performance. Significant variations in agronomic performance were revealed by the inbred lines evaluated, indicating the presence of high genetic diversity

among them for potential utilization towards production of hybrid varieties. Among the inbred lines, the highest husked fresh ear yield was obtained from TSN-S8 with value of 6549 kg ha⁻¹, but this was not significantly higher than those obtained from TSK-S8, BAK-S8 and MAN-S8 (6483, 6402 and 5798 kg ha⁻¹, respectively).

Microsatellite markers exhibited high Shannon's information index (I), Nei's expected heterozygosity (Nei's), and polymorphic information content (PIC), with mean values of 1.053, 0.586 and 0.582 respectively, indicating their appropriateness in detecting genetic variability among the inbred lines. Molecular analysis of variance showed that 92.88% of the total variation occurred among the inbred lines while only 7.11% occurred within the inbred lines. Shannon's information index and Nei's gene diversity coefficient showed that Chromosome 10 was the most informative chromosome (I = 1.311 and Nei's = 0.703), while Chromosome 2 had the least variation among the chromosomes evaluated (I = 0.762 and Nei's = 0.456). Chromosome 4 was found to possess the highest number of pairs of alleles in linkage disequilibrium (122 pairs), while Chromosome 6 was found to have only six pairs of alleles in linkage disequilibrium. The inbred lines were assigned into five main heterotic groups based on their agronomic and molecular characteristics. MAS-S8, DFS-S8, TSN-S8, TZF-S8 and SBY-S8 each from a different heterotic group were selected as parental inbred lines for a diallel cross.

From results of evaluations on the hybrids, Hybrids H2 and H1 were found to have the highest fresh ear yield in Serdang, with mean values of 15475 and 15124 kg ha⁻¹, respectively, while Hybrids H3 and H1 revealed the highest fresh ear yield in Sepang (15143 and 14998 kg ha⁻¹, respectively). There was no significant difference in fresh ear

yields between these hybrids and that of the control variety (Hybrid 968), indicating that fresh ear yield of these hybrids could be comparable to those of the commercial hybrids available in the market. Among the traits measured, husked fresh ear yield exhibited the highest mid- and high-parent heterosis at the two locations of study. In general, Hybrids H1, H2 and H3 had high and consistent estimates of mid- and high-parent heterosis for all traits measured, indicating that they accumulated favorable genes possessed by their parental inbred lines.

Combining ability analysis revealed presence of significant additive and non-additive gene actions in control of the traits measured. However, additive gene effects were found to be relatively more important in the control of yield and yield components in the hybrids, based on greater GCA mean squares than SCA mean squares that they possessed. DFS-S8, with the highest positive and significant GCA for husked fresh ear yield in Serdang, Sepang and the two locations combined (3091.54, 2370.98 and 2731.26 respectively), was identified as the best general combiner among the parental inbred lines for high yield and yield components in its crosses. DFS-S8 X MAS-S8 (H3), DFS-S8 X SBY-S8 (H4), TFZ-S8 X TSN-S8 (H5) and TFZ-S8 X SBY-S8 (H7) were the best cross combinations, with favorable positive SCA estimates for yield and yield related traits at each location and locations combined. The Wr-Vr graphical analysis showed that non-additive gene effects that controlled the traits were overdominance for all traits measured. The overdominance mode of gene action was also revealed through greater estimates of variation due to dominance effects of genes

(H_1 and H_2) than additive effect (D), and estimates of average degree of dominance higher than unity.

The high true-sense heritability estimates (more than 50%) revealed the presence of high proportion of genetic variability in the whole phenotypic variability, while the presence of high broad-sense heritability estimates (more than 80%) indicate a close correspondence between the genotype and the phenotype, due to a relatively smaller contribution of the environment to the phenotype. The narrow-sense heritability estimates revealed were however generally lower than the broad-sense heritability estimates, indicating the preponderance of non-additive gene actions in the inheritance of all traits measured.

Significant positive associations were obtained between genetic similarities of the parental inbred lines estimated based on microsatellite markers with more than 30% polymorphic bands and SCA estimates for number of ears per hectare, husked and dehusked ear weights, TSS, husked and dehusked ear diameter and number of kernels per row. This indicates the effectiveness of molecular markers for prediction of hybrid performance from those tropical sweet corn inbred lines. In conclusion, among the 10 tropical hybrids produced, Hybrids H1, H2 and H3 exhibited high yield performance and high magnitude of yield components at each location and the two locations combined. It is thus suggested that these promising hybrids be further tested in large scale multi-locational trials before their release as new tropical sweet corn hybrid varieties in Malaysia.

Abstrak thesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Doktor Falsafah

**POTENSI GENETIK TITISAN INBRED JAGUNG MANIS TERPILIH DAN
ANALISIS KEUPAYAAN BERGABUNGNYA DIBANTU OLEH PENANDA
MIKROSATELIT DNA**

Oleh

PEDRAM KASHIANI

Mei 2012

Pengerusi: Prof. Ghizan Saleh, PhD

Fakulti: Pertanian

Satu kajian telah dijalankan untuk menilai potensi titisan-titisan inbred jagung manis yang dibentuk daripada sumber populasi yang berbeza, untuk menentukan kepelbagaian genetik di kalangan titisan-titisan inbred berkenaan berdasarkan prestasi agronomi dan penanda DNA mikrosatelit, untuk mengenalpasti kumpulan-kumpulan heterotik utama di kalangan titisan-titisan inbred tersebut untuk pemilihan induk yang berpotensi bagi pengeluaran hibrid, dan untuk menilai keupayaan bergabung di kalangan induk titisan inbred terpilih dalam kacukan diallel. Prestasi dan heterosis hibrid-hibrid kacukan tunggal dinilai di dua lokasi yang berbeza, Serdang dan Sepang. Jarak genetik di kalangan titisan-titisan inbred yang ditunjukkan oleh penanda mikrosatelit digunakan untuk meramalkan prestasi hibrid.

Tiga belas titisan inbred jagung manis yang telah beradaptasi di persekitaran tropika telah dinilai untuk prestasinya. Variasi yang ketara dalam prestasi agronomi telah

ditunjukkan oleh titisan-titisan inbred yang dinilai, menunjukkan terdapatnya kepelbagaian genetik yang tinggi di kalangannya untuk potensi penggunaan ke arah pengeluaran varieti hibrid. Di kalangan titisan-titisan inbred, hasil tongkol segar berkulit tertinggi diperolehi dari TSN-S8 dengan nilai 6549 kg ha⁻¹, tetapi ianya secara berertinya tidak lebih tinggi daripada yang diperolehi dari TSK-S8, BAK-S8 dan MAN-S8 (masing-masing 6483, 6402 dan 5798 kg ha⁻¹).

Penanda mikrosatelit menunjukkan nilai yang tinggi bagi maklumat indeks Shannon (I), heterozigositi dijangka Nei (Nei's), dan kandungan maklumat polimorfik (PIC) dengan nilai min masing-masing sebanyak 1.053, 0.586 dan 0.582, menunjukkan kesesuaiannya dalam mengesan variabiliti genetik di kalangan titisan-titisan inbred tersebut. Analisis varians molekul menunjukkan bahawa 92.88% daripada jumlah variasi berlaku di kalangan titisan inbred manakala hanya 7.11% berlaku dalam titisan inbred. Indeks maklumat Shannon, dan pekali kepelbagaian gen Nei menunjukkan bahawa Kromosom 10 adalah kromosom yang paling bermaklumat (I = 1.311 dan Nei's = 0.703), manakala Kromosom 2 mempunyai variasi yang paling rendah di kalangan kromosom yang dinilai (I = 0.762 and Nei's = 0.456). Kromosom 4 didapati mengandungi bilangan pasangan alel yang tertinggi dalam ketakseimbangan rangkaian (122 pasang), manakala Kromosom 6 didapati mengandungi hanya enam pasangan alel dalam ketakseimbangan rangkaian. Titisan inbred dibahagikan kepada lima kumpulan heterotik utama berdasarkan kepada ciri-ciri agronomi dan molekul. MAS-S8, DFS-S8, TSN-S8, TZF-S8 dan SBY-S8, tiap satunya dari kumpulan heterotik yang berbeza telah dipilih sebagai induk titisan inbred untuk kacukan diallel.

Daripada keputusan penilaian hibrid, Hibrid H2 dan H1 didapati mempunyai hasil tongkol segar yang tertinggi di Serdang dengan nilai min sebanyak masing-masing 15475 dan 15124 kg ha⁻¹, manakala hibrid H3 dan H1 didapati mempunyai hasil tongkol segar tertinggi di Sepang (masing-masing 15143 dan 14998 kg ha⁻¹) di Sepang. Tidak terdapat perbezaan yang bererti dalam hasil tongkol segar antara hibrid-hibrid tersebut dan varieti kawalan (Hybrid 968), menunjukkan bahawa hasil tongkol segar hibrid tersebut setanding dengan hasil hibrid komersial yang terdapat dalam pasaran. Antara sifat-sifat yang diukur, hasil tongkol segar berkulit mempamerkan heterosis pertengahan induk dan induk terbaik yang tertinggi di dua lokasi kajian. Secara amnya, Hibrid H1, H2 dan H3 memperolehi anggaran heterosis pertengahan induk dan induk terbaik yang tinggi dan konsisten untuk semua sifat-sifat yang diukur, menunjukkan bahawa ianya telah menghimpunkan gen-gen yang diinginkan yang dimiliki oleh titisan-titisan induk inbrednya sebagai.

Analisis keupayaan bergabung menunjukkan terdapatnya tindakan gen menambah dan tidak menambah yang bererti dalam pengawalan ciri-ciri yang diukur. Walau bagaimanapun, kesan gen menambah didapati secara perbandingannya, lebih penting dalam pengawalan hasil dan komponen-komponen hasil di dalam hibrid-hibrid, berdasarkan varians GCA yang lebih besar daripada varians SCA yang dimilikinya. DFS-S8 dengan GCA positif dan bererti yang tertinggi untuk hasil tongkol segar berkulit di Serdang, Sepang dan apabila kedua-dua lokasi digabungkan (masing-masing 3091.54, 2370.98 dan 2731.26) telah dikenalpasti sebagai penggabungan yang terbaik di kalangan induk titisan inbred bagi hasil dan komponen-komponen hasil yang tinggi

dalam kacukannya. DFS-S8 × MAS-S8 (H3), DFS-S8 × SBY-S8 (H4), TFZ-S8 × TSN-S8 (H5) dan TFZ-S8 × SBY-S8 (H7) adalah kombinasi kacukan terbaik, dengan anggaran SCA positif yang diinginkan bagi hasil dan ciri-ciri yang berkaitan hasil di setiap lokasi dan apabila kedua-dua lokasi digabungkan. Analisa grafik W_r-V_r menunjukkan bahawa kesan gen bukan menambah yang mengawal ciri-ciri adalah kesan dominan melampau untuk kesemua ciri-ciri yang diukur. Mod tindakan gen dominan melampau juga ditunjukkan melalui anggaran variasi yang lebih besar yang diakibatkan oleh kesan gen dominan (H1 dan H2) berbanding kesan gen menambah (D), dan anggaran purata darjah dominan yang lebih tinggi daripada satu.

Anggaran kebolehwarisan sebenar yang tinggi (lebih daripada 50%) menunjukkan wujudnya sebahagian besar daripada variabiliti genetik pada keseluruhan variabiliti fenotip, manakala kewujudan anggaran kebolehwarisan luas yang tinggi (lebih daripada 80%) menunjukkan perkaitan yang rapat antara genotip dan fenotip, disebabkan oleh sumbangan persekitaran yang agak kecil kepada fenotip. Anggaran kebolehwarisan sempit yang dipamerkan bagaimanapun pada umumnya lebih rendah daripada anggaran kebolehwarisan luas, menunjukkan kewujudan tindakan gen bukan menambah yang tinggi dalam pewarisan semua ciri-ciri yang diukur.

Perkaitan yang positif secara bererti telah diperolehi antara persamaan genetik induk titisan inbred yang dianggarkan berdasarkan penanda mikrosatelit dengan lebih daripada 30% jalur polimorfik dan anggaran SCA untuk bilangan tongkol sehektar, berat tongkol berkulit dan tanpa kulit, jumlah kepekatan pepejal terlarut (TSS), diameter tongkol

berkulit dan tanpa kulit dan bilangan bijian sebaris. Ini menunjukkan keberkesanan penanda molekul bagi menjangka prestasi hibrid dari titisan inbred jagung manis tropika tersebut. Kesimpulannya, antara 10 kacukan hibrid-hibrid tropika yang telah dihasilkan, Hibrid H1, H2 dan H3 mempamerkan prestasi hasil yang tinggi dan magnitud komponen-komponen hasil yang tinggi di setiap lokasi dan gabungan antara kedua-dua lokasi. Oleh itu adalah dicadangkan bahawa hibrid-hibrid yang berpotensi ini diuji selanjutnya di dalam pengujian pelbagai lokasi yang berskala besar sebelum diisytiharkan sebagai varieti hibrid jagung manis tropika yang baharu di Malaysia.

ACKNOWLEDGEMENTS

All praises and thanks are due to “Almighty Allah” the most beneficial, the merciful, the competent, the omnipresent and compassionate whose bounteous blessing and exaltation enabled me to complete this research work as well as any other work throughout my entire life.

With profound and deep sense of devotion, I would like to thank most sincerely Professor Dr. Ghizan Saleh, my major professor and chair of my supervisory committee for his guidance and support not only in accomplishing this research work and doctoral level studies at Universiti Putra Malaysia but also in other aspects throughout the entire stay in Malaysia. The impression of his fatherly attitude, insightful instructions, useful comments and legitimate help will never go unremembered. I would also like to extend my sincere thanks and appreciation to Professor Dr. Jothi Malar Panandam, Dr. Nur Ashikin Psyquay Abdullah and Dr. Ahmad Selamat, the members of my supervisory committee, for their helpful advice, guidance, constructive comments and encouragements during the course of my study. They have been a wonderful committee and great resources of valuable ideas which I have found incredibly helpful.

I would like to convey my sincere gratitude, appreciation and thanks to various institutions and individuals who assisted and contributed to the successful completion of this study. Special thanks go to the Ministry of Science, Technology and Innovation, Malaysia (MOSTI) for the financial support of the research under e-Science Fund

(Project No.: 05-01-04-SF0700) through Professor Dr. Ghizan Saleh. Many thanks and appreciations also go to Universiti Putra Malaysia (UPM) for providing me the financial support under the Graduate Research Fellowship (GRF) and Special Graduate Research Allowance (S-GRA). I would like to express my special thanks and appreciation to the management and staff of the Agro-biotechnology Institute, Malaysia (ABI), in particular Dato Dr. Hassan Mat Daud and Dr. Abas Mazni Othman, for their kind permission and hospitality in using the institute's facilities for conducting the molecular part of the research work. I am indebted to Professor Dr. Yasuo Ukai, from the University of Tokyo, Japan, Professor Dr. Joseph Felsenstein, from the University of Washington, USA, and Professor Dr. Masatoshi Nei, from the Pennsylvania State University, USA for assisting me with some data analysis.

My sincere appreciations also go to my colleagues, the graduate and undergraduate students of the Plant Breeding Laboratory, Crop Science Department, Universiti Putra Malaysia for their support and encouragements. I would also like to express my special thanks to Mr. Majid Foroughi, Mr. Ali Ranjbarfard and Miss Maizura Abu Sin for their continuous support in field trial activities and data collection during the research work. The help and assistance provided by Mr. Rosdi Abd Ghani, Mr. Mohd Helmi Hamisan and all of the staff of Field 10, Universiti Putra Malaysia are highly appreciated. Special thanks also go to all of staff of the Faculty of Agriculture, Universiti Putra Malaysia for facilitating my study in one way or another. I am very much thankful to my dear friends, Mr. Sohail Soleimani, Miss Reiko Nakamura, Mr. Ramin Jorfi, Dr. Hadi Hajarian, Dr. Mokhtar Mohajer, Miss Parisa Honari, Mr. Majid Foroughi, Dr. Yousof Gheisari, Dr.

Nahid Babaei, Dr. Reza Hashemi and Mrs. Shabnam Talebi, for their kind friendship, moral support and encouragements during the past five years.

Most of all, I am very much grateful to express my deep feelings of true love and respects for my beloved father, Ahmad and my lovely mother, Fatimah for having me, for their understanding in giving me the freedom to choose my life path, and for their endless love, support and sacrifices. Deep from my heart, I would also like to acknowledge my sister, Samira and my brother, Amir Bahram for their love and understanding.

May blessing be upon all of you!

I certify that a Thesis Examination Committee has met on 18 May 2012 to conduct the final examination of Pedram Kashiani on his thesis entitled “Genetic Potential of Selected Sweet Corn Inbred Lines and Analysis of Their Combining Ability Assisted by Microsatellite DNA Markers” in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U. (A) 106] 15 March 1998. The Committee recommends that the student be awarded the Doctor of Philosophy.

Members of the Thesis Examination Committee were as follows:

Mihdzar Abdul Kadir, PhD

Associate Professor
Faculty of Agriculture
Universiti Putra Malaysia
(Chairman)

Mohd Rafii Yusop, PhD

Associate Professor
Faculty of Agriculture
Universiti Putra Malaysia
(Internal Examiner)

Halimi Mohd Saud, PhD

Associate Professor
Faculty of Agriculture
Universiti Putra Malaysia
(Internal Examiner)

Kadambot H.M. Siddique, PhD

Winthrop Professor
Faculty of Natural and Agricultural Sciences
The University of Western Australia
(External Examiner)

SEOW HENG FONG, PhD

Professor and Deputy Dean
School of Graduate Studies
Universiti Putra Malaysia
Date:

This thesis was submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfillment of the requirement for the degree of Doctor of Philosophy. The members of the Supervisory Committee were as follows:

Ghizan Saleh, PhD

Professor
Faculty of Agriculture
