Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfillment of the requirement for the degree of Master of Science

ESTABLISHMENT OF A CELL-BASED REPORTER ASSAY FOR SCREENING OF HYPOXIA-INDUCIBLE FACTOR ACTIVITIES

By

LIEW SIEN YEI

November 2013

Chairman: Norazizah Shafee, PhD

Faculty: Biotechnology and Biomolecular Sciences

Hypoxia-inducible factor (HIF) is one of the most important transcription factors involved in cells survival under low oxygen concentrations, termed hypoxia. Hypoxia is associated with various human diseases from ischemic injuries to cancer. The central role of HIF in these conditions has made it as one of the main target molecules for drug discovery. Demand for HIF assay system is high. Cell-based HIF assay systems are preferred since they can provide direct data for intracellular biochemical changes. HIF assay systems which are currently available in the market offer limited sensitivity with restricted reproducibility at a high cost. Therefore, in the present study, a HIF assay was successfully developed. The system used a Saos-2 human osteosarcoma cell line which is one of the most studied cell lines to express a luciferase protein in response to HIF activation. The luciferase gene construct which was previously cloned downstream of four copies of a hypoxia response element (HRE) of the *erythropoietin (EPO)* gene. *EPO* is one of the specific target genes of HIF. Therefore this assay can be used to

measure HIF activation upon induction by candidate drugs of interest, by measuring the luciferase expression. This highly sensitive assay system offers a 40-times increased sensitivity compared to the currently available systems. This aspect would be highly beneficial to researchers since the increase in sensitivity can contribute towards result consistency and reproducibility leading to reduced wastage of precious drug candidates.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Master Sains

**PEMBINAAN ASAI BERASAS SEL UNTUK PEMERIKSAAN AKTIVITI
FAKTOR INDUKSI HIPOKSIA**

Oleh

LIEW SIEN YEI

November 2013

Pengerusi: Norazizah Shafee, PhD

Fakulti: Bioteknologi dan Sains Biomolekul

Faktor induksi hipoksia (HIF) merupakan faktor transkripsi yang amat penting dengan penglibatannya dalam kemandirian sel pada kepekatan oksigen yang rendah, juga dikenali hipoksia. Hipoksia dikaitkan dengan pelbagai jenis penyakit manusia dari kecederaan iskemia kepada kanser. HIF yang memainkan peranan penting dalam keadaan ini telah menjadikannya sebagai salah satu sasaran molekul utama dalam penemuan dadah. Permintaan sistem pengasaian HIF adalah tinggi. Sistem pengasaian HIF berasas sel adalah diutamakan kerana sistem ini dapat membekalkan data langsung kepada perubahan biokimia intrasel. Sistem pengasaian HIF yang kini didapati di pasaran menawarkan sensitiviti terhad dan kebolehasilan yang tersekat pada kos yang tinggi. Maka, satu asai HIF telah berjaya dibina dalam kajian ini. Sistem ini menggunakan titisan sel osteosarkoma manusia, Saos-2 yang merupakan salah satu jenis titisan sel yang meluas dikaji selidik untuk mengekspreskan protein lusiferase yang

bergerak balas kepada pengaktifan HIF. Konstruk gen lusiferase ini adalah diklon di bawah empat salinan elemen respon hipoksia dalam gen *eritropoietin (EPO)*. *EPO* adalah salah satu sasaran khusus HIF. Oleh itu, asai ini dapat digunakan untuk mengukur pengaktifan HIF semasa induksi oleh calon dadah yang dipentingkan dengan mengukur ekspresi lusiferase. Sistem pengasaan yang sangat peka ini menawarkan 40-kali kenaikan dalam sensitivitinya jika dibandingkan dengan sistem-sistem yang sedia ada. Ini akan banyak mendatangkan manfaat kepada penyelidik-penyelidik kerana kenaikan sensitiviti ini dapat menyumbang kepada keputusan yang lebih konsisten dan kebolehasilan tinggi, dan juga mengurangkan pembaziran calon dadah yang berharga.

ACKNOWLEDGEMENTS

My heartfelt and deepest thanks to my research supervisor, Assoc. Prof. Dr. Norazizah Shafee for her willingness to advice and guide me with patience throughout my study and thesis write up. I am also indebted to her as she always inspires, gives continuous support and encouragement to me. I sincerely acknowledge my co-supervisors Prof. Datin Paduka Dr. Khatijah Yusoff and Dr. Syahrilnizam Abdullah for their trust and the facilities involved in my research. My greatest appreciation goes to Prof. Eric Stanbridge for his generosity in sharing his ideas, advice and suggestions throughout my study.

I would like to thank Dr. Eddie Chia for guiding me on the cloning work. Big thank-yous to my amazing colleagues in Virology laboratory 143 especially Wei Choong, Kah Fai, Wuan Ting, Aini, Hafifi, Sze Yen, Yee Wei and Woo Kiat for their encouragement, sharing of their laboratory skills, discussion and suggestions. I am so glad to have them to make my research life more delightful and fun. A special thank to my best friend, Li Teng for being there during my study and personal life. I would like to thank all the friendly staff of the Department of Microbiology and Biochemistry for their cooperation.

No words are able to fully express my gratitude to my dearest grandma, parents, god parents and brothers for their love, understanding and support. I can never thank you enough to my loving husband, Dann Teoh for his caring, unconditional love, understanding, patience and even being my only “personal” lab assistant while I was pregnant! Certainly, thank God for His gift to me: my precious baby Dominic during my Master study. This little monster is always my motivation to work hard in life!

I certify that a Thesis Examination Committee has met on 11 November 2013 to conduct the final examination of Liew Sien Yei on her thesis entitled “Establishment of a Cell-based Reporter Assay for Screening of Hypoxia-inducible Factor (HIF) activities” in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The Committee recommends the student be awarded the Master of Science.

Members of the Thesis Examination Committee were as follows:

Sieo Chin Chin, PhD
Associate Professor
Faculty of Biotechnology and Biomolecular Sciences
Universiti Putra Malaysia
(Chairman)

Syahida binti Ahmad, PhD
Senior Lecturer
Faculty of Biotechnology and Biomolecular Sciences
Universiti Putra Malaysia
(Internal Examiner)

Noorjahan Banu binti Mohammed Alitheen, PhD
Associate Professor
Faculty of Biotechnology and Biomolecular Sciences
Universiti Putra Malaysia
(Internal Examiner)

Chua Kek Heng, PhD
Professor
Faculty of Medicine Building
Universiti of Malaya
(External Examiner)

SEOW HENG FONG, PhD
Professor and Deputy Dean
School of Graduate Studies
Universiti Putra Malaysia

Date: 27 November 2013

This thesis was submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfillment of the requirement for the degree of Master of Science. The members of the Supervisory Committee are as follows:

Norazizah Shafee, PhD

Associate Professor

Faculty of Biotechnology and Biomolecular Sciences

Universiti Putra Malaysia
