**FLEXIBLE JOB SHOP SCHEDULING USING PRIORITY
HEURISTICS AND GENETIC ALGORITHM**

By

HAMID GHAANI FARASHAHI

**Thesis Submitted to the School of Graduate Studies, Universiti Putra Malaysia
in Fulfilment of the Requirements for the Degree of Master of Science**

November 2010

DEDICATION

This thesis is dedicated to: who their true love and support were behind my success
My dearest parents: for all of the times you were by my side to teach me the value
of diligence, courage and decency and help me to celebrate my successes.

Abstract of thesis presented to the Senate of Universiti Putra Malaysia
in fulfilment of the requirement for the degree of Master of Science

**FLEXIBLE JOB SHOP SCHEDULING USING PRIORITY
HEURISTICS AND GENETIC ALGORITHM**

By

HAMID GHAANI FARASHAHI

November 2010

Chairman: B.T.Hang Tuah Baharudin, PhD

Faculty: Engineering

In this research, flexible job shop scheduling problem has been studied. The aim of this research is to minimize the maximum completion time (makespan). The job shop scheduling is very common in practice and uniform machines (parallel machines with different speeds) have been used in job shop environment for flexibility. Flexible job shop scheduling consists of multistage which in each stage there are one or several parallel machines with different speeds. Each job crosses all these stages based on distinct routing which is fixed and known in advance. The relevant operation is processed by only one of the uniform machines in that stage.

Due to Non-deterministic Polynomial-time hard (NP-hard) nature of problem, in order to generate good solution in a reasonable computation time two solution methodologies are proposed. In the first method, five heuristic procedures based on priority rules have been presented and the performances of proposed heuristics have

been compared with each other in order to minimize the makespan. Experimental results over all instances indicated that the most work remaining rule with earliest completion time rule (MWKR-ECT) and earliest completion time rule (ECT) achieved the minimum of makespan up to 65% and 34% of all instances in comparison with other proposed heuristic procedures. In the next method, a genetic algorithm has been developed. It has been shown that proposed genetic algorithm with a reinforced initial population (GA2) has better efficiency compared to a proposed genetic algorithm with fully random initial population (GA0). Then, the validation of proposed genetic algorithm with reinforced initial population (GA2) has been checked with random keys genetic algorithm (RKGA). The results of computations showed that an improved rate of 27% has been achieved according to average of loss.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia
sebagai memenuhi keperluan untuk ijazah Master Sains

**PENJADUALAN BENGKEL KERJA FLEKSIBEL MENGGUNAKAN
PRIORITI HEURISTIK DAN ALGOTRITMA GENETIK**

Oleh

HAMID GHAANI FARASHAHI

November 2010

Pengerusi: B.T.Hang Tuah Baharudin, PhD

Fakulti: Kejuruteraan

Dalam penyelidikan ini, masalah penjadualan bengkel kerja fleksibel telah dikaji. Tujuan penyelidikan ini ialah untuk meminimumkan masa siap maksimum (makespan). Penjadualan bengkel kerja sangat biasa bagi praktikal dan mesin-mesin seragam (mesin-mesin selari dengan kelajuan yang berbeza) telah digunakan dalam persekitaran bengkel kerja untuk fleksibiliti. Penjadualan bengkel kerja fleksibel mengandungi berbilang tahap yang dimana setiap tahap terdapat satu atau beberapa mesin selari dengan kelajuan berbeza. Setiap kerja melintasi semua peringkat ini berdasarkan penghalaan berbeza yang ditetapkan dan mengetahui dahulu. Operasi berkaitan diproses oleh hanya salah satu mesin seragam dalam peringkat itu.

Disebabkan sifat masalah NP-hard, dua kaedah berdasarkan peraturan-peraturan prioriti dan algoritma genetik telah dicadangkan untuk mencapai penyelesaian hampir optimum. Dalam kaedah pertama, lima prosedur heuristik berdasarkan peraturan-peraturan prioriti telah dibentangkan dan prestasi heuristik dicadangkan telah dibandingkan dengan satu sama lain supaya meminimumkan makespan. Hasil percubaan mengenai semua contoh menunjukkan bahawa kebanyakan kerja baki dengan masa siap terawal (MWKR-ECT) dan masa siap terawal (ECT) mencapai minimum makespan sehingga 65% dan 34% bagi semua contoh dalam perbandingan dengan prosedur-prosedur heuristik lain yang dicadangkan. Dalam kaedah kedua, algoritma genetik telah disampaikan. Pertama, ia telah menunjukkan algoritma genetik yang dincadangkan dengan satu memperkukuhkan populasi awal mempunyai kecekapan lebih baik berbanding dengan satu algoritma genetik yang dicadangkan dengan populasi awal yang rawak sepenuhnya. Kemudian, pengesahan algoritma genetik yang dicadangkan dengan memperkukuhkan populasi awal telah diperiksa dengan kunci-kunci rawak algoritma genetik (RKGA). Keputusan pengiraan telah membuktikan satu kadar bertambah baik iaitu 27% telah mencapai mengikut purata "loss".

ACKNOWLEDGEMENTS

I am truly grateful to The Almighty God, for given me strength and patience to complete this research work. I would like to thank Allah for giving me good health throughout the research until the completion of this thesis.

I would like to express my deepest gratitude to my supervisory committees, Dr.B.T. Hang Tuah Baharudin, Prof. Ir. Dr. Md. Yusof Ismail and Prof. Dr. Rosnah Mohd. Yusuff for their endless support, guidance, kind words, encouragement, ideas and help throughout my research work. I really appreciate their efforts.

I would like also to thank the technical staffs of the design and simulation lab, Faculty of Engineering, Universiti Putra Malaysia, Mr.Syed Ruslim Bin Syed Amran and Mr. Mohamad Azmi Mohd Omar Ali for their kindness and allowing me to implement my program in the lab.

My last gratitude but not the least, is dedicated to my parents for their love, kind support, understanding and encouragement during my study.

APPROVAL

I certify that an Examination Committee met on 15 November 2010 to conduct the final examination of Hamid Ghaani Farashahi on his thesis entitled “Flexible Job Shop Scheduling Using Priority Heuristics And Genetic Algorithm” in accordance with the Universitis and University Colleges Act 1971 and the Constitution of Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The Committee recommends that the student be awarded the Master of Science.

Members of the Thesis Examination Committee were as follows:

Tang Sai Hong, PhD

Associate Professor

Faculty of Engineering

Universiti Putra Malaysia

(Chairperson)

Napsiah Ismail, PhD

Associate Professor

Faculty of Engineering

Universiti Putra Malaysia

(Internal Examiner)

Faieza Abdul Aziz, PhD

Senior Lecturer

Faculty of Engineering

Universiti Putra Malaysia

(Internal Examiner)

Mohd Amin Abd Majid, PhD

Associate Professor

Faculty of Mechanical Engineering

Universiti Teknologi Petronas

Malaysia

(External Examiner)

SHAMSUDDIN SULAIMAN, PhD

Professor and Deputy Dean
