DEDICATIONS

To my most beloved wife, Touran,
for her support of all of my endeavors, regardless of how seemingly outlandish,
throughout my life. I greatly appreciate her patience, understanding
and support over the years.

To my lovely children, Nima and Parnya,
for making everything worthwhile.

To my parents, my elder brother Ali and my dear sister Fatemeh, for the support,
their true love, constant trust, principle guide and making me into the person I am
today.

Abstract of the thesis presented to the Senate of Universiti Putra Malaysia in fulfillment of the requirement for the degree of Master of Science

**GROWTH PERFORMANCE OF TIGER GROPER JUVENILES
(*Epinephelus fuscoguttatus* Forsskal) WITH VARYING STOCKING DENSITIES IN OPEN FLOW-THROUGH AND CLOSED SYSTEMS**

By

REZA SALARI

January 2013

Chairman: Associate Professor Che Roos Saad, PhD

Faculty : Agriculture

Two tests were carried out in the present research work to examine the influence of the nursery rearing period as a critical phase on minimizing the cannibalism issue in the aquaculture industry. The relationship between a range of stocking densities and fish growth rates in different flow-through conditions of water (open flow-through and closed-system) was additionally scrutinized. The aim was to determine the optimum stocking density and appropriate water flow system for *E. fuscoguttatus* juveniles to survive. Observations were made from December 2010 to February 2011 at the Marine Finfish Production and Research Center, Tg. Demong, Besut, Terengganu.

The purpose of the initial experiment was to study how various stocking densities in open flow-through water affect the critical rearing phase of tiger grouper juveniles. The densities studied are 1fish/l (T1), 3fish/l (T2), and 5fish/l (T3). Following the 42-day nursery stage, the fish grown in the T2 condition had the top final mean body

weight (10.45 ± 0.17 g), as well as the utmost total length (84.92 ± 3.04 mm). The variation noted with respect to the Specific Growth Rate, Feed Conversion Ratio, Daily Weight Gain and Protein Efficiency Ratio between T2 and the other treatments was $P<0.05$. The outcome of this experiment therefore indicates that fish stocked at a density of 3 fish per liter demonstrated enhanced size frequency, growth and final biomass in contrast to the other two stocking densities. Yet, negligible statistical disparities of $P>0.05$ were noted for the condition and survival rearing among various treatments during six nursery weeks in the open flow-through water system.

A separate trial assessed the effects of varying stocking densities in the critical developing stage of *E. fuscogattatus* juveniles in a closed system. To determine the aptness in nursing early juveniles leaving the hatchery, the three grouper juvenile treatments utilized in this second experiment were 1fish/l (T1), 3fish/l (T2) and 5fish/l (T3). After 42 culture days in the closed system experiment, differences found for weight, length, and other growth parameters of fish reared at 1, 3 and 5fish/l were insignificant at $P>0.05$.

The growth of young grouper juveniles in various nursery culture systems was recorded following 42 days of tending. Generally, according to the results, the final mean body weight and total length, Specific Growth Rate and Feed Conversion Ratio were numerically superior in the open flow-through structure, with 10.45 ± 0.17 g, 84.92 ± 3.04 mm, $13.05\pm0.12\%$ and 1.22 ± 0.04 in contrast to the closed system, in which the values were 6.90 ± 0.19 g, 69.42 ± 1.37 mm, $12.17\pm0.44\%$ and 1.38 ± 0.03 , respectively. Besides, in the flow-through water system, the fish grew at a higher rate numerically (0.184 - 0.25 g·f $^{-1}$ d $^{-1}$) than those in the closed system (0.160 - 0.164 g·f $^{-1}$ d $^{-1}$). No difference in the development and survival of fish in both system densities was noted. This study thus recommends the use of an open flow-through system for

culturing tiger grouper juveniles, as it seems to be more efficient than a closed system.

PRESTASI PERTUMBUHAN JUVANA KERAPU HARIMAU (*Epinephelus fuscoguttatus Forsskal*) DENGAN PELBAGAI KEPADATAN STOK DALAM SISTEM ALIRAN AIR TERBUKA DAN SISTEM TERTUTUP

Oleh

REZA SALARI

Januari 2013

Pengerusi : Profesor Madya Che Roos Saad, PhD

Fakulti : Pertanian

Satu kajian yang tertumpu pada tempoh penternakan nurseri sebagai fasa kritikal untuk mengurangkan masalah kanibalisme dalam industri akuakultur telah dijalankan. Kajian ini telah dijalankan dalam dua eksperimen untuk mengkaji kesan, serta korelasi antara densiti stok yang berbeza dan kadar pertumbuhan ikan dalam pengaliran air yang berbeza (aliran palung terbuka dan aliran tertutup). Tujuannya ialah untuk mencari kadar kemasukan ikan yang optima bagi aliran air yang berkenaan untuk meningkatkan pertumbuhan dan kelangsungan hidup juvana *E. fuscoguttatus* dari Disember 2010 hingga Februari 2011 di Pusat Penyelidikan Pengeluaran Ikan Marin, Tg. Demong, Besut, Terengganu.

Kajian pertama adalah untuk menentukan kesan kemasukan ikan (ketumpatan) yang berbeza dalam keadaan aliran air terbuka terhadap juvana kerapu harimau semasa tempoh penternakan kritikal. Tiga ketumpatan yang berbeza telah disediakan; i)

seekor ikan seliter (T1), ii) tiga ekor ikan seliter (T2), dan iii) lima ekor ikan seliter (T3). Selepas 42 hari fasa nurseri, ikan yang diternak pada kepadatan tiga ekor ikan seliter menunjukkan berat akhir badan tertinggi dengan min 10.45 ± 0.17 g, dan panjang tertinggi sebanyak 84.92 ± 3.04 mm. Terdapat perbezaan yang signifikan ($P < 0.05$) untuk kadar pertumbuhan spesifik (SGR), nisbah pertukaran makanan (FCR), pertambahan berat harian (DWG) dan nisbah kecekapan protein (PER) antara T2 dan rawatan lain. Berdasarkan keputusan eksperimen ini, ia telah mendapati bahawa, kepadatan stok 3 ekor ikan / L menggalakkan pertumbuhan yang lebih baik, kekerapan saiz dan biomas akhir berbanding dengan kadar stok lain. Walau bagaimanapun, tiada perbezaan yang bermakna ($P > 0.05$) dalam kadar hidup dan faktor keadaan telah didapati antara rawatan yang berbeza selama 6 minggu peringkat nurseri dalam keadaan aliran air terbuka.

Satu lagi eksperimen telah dijalankan untuk mengkaji kesan densiti kemasukan yang berbeza dalam tempoh pemeliharaan kritikal juvana *E. fuscogattatus* dalam sistem akuakultur kitaran tertutup. Untuk mencari kesesuaian dalam pendedederan awal bagi juvana selepas penetasan, tiga rawatan bagi juvana ikan kerapu telah digunakan dalam eksperimen ini : i) T1-satu ekor ikan seliter, ii) T2-tiga ekor ikan seliter dan iii) T3- lima ekor ikan seliter. Selepas 42 hari tempoh pemeliharaan dalam eksperimen ini, tiada perbezaan yang signifikan ($P > 0.05$) telah dikesan bagi panjang, berat, dan parameter tumbesaran yang lain bagi ikan yang dipelihara dalam semua rawatan. Prestasi pertumbuhan awal juvana kerapu di bawah sistem nurseri yang berbeza pada densiti kepadatan yang berlainan telah dinilai pada awal dan selepas 42 hari tempoh penternakan.

Secara amnya keputusan jelas menunjukkan bahawa, dalam sistem aliran terbuka prestasi pertumbuhan, ikan memperolehi min berat badan akhir, min jumlah panjang

akhir, kadar pertumbuhan spesifik dan nisbah pertukaran makanan adalah lebih baik dengan nilai $10.45 \pm 0.17\text{g}$, $84.92 \pm 3.04\text{mm}$, $13.05 \pm 0.12\%$ dan 1.22 ± 0.04 masing-masing jika dibandingkan dengan ikan dalam sistem aliran tertutup dengan nilai min nya ialah $6.90 \pm 0.19\text{g}$, $69.42 \pm 1.37\text{mm}$, $12.17 \pm 0.44\%$ dan 1.38 ± 0.03 , masing-masing. Dari sudut yang lain, kesan sistem kultur terhadap pertumbuhan adalah berbeza, dimana ikan dalam sistem aliran air terbuka mempunyai kadar pertumbuhan yang lebih tinggi ($0.184 - 0.25\text{gf}^{-1}\text{d}^{-1}$) dibandingkan dengan ikan dalam sistem aliran tertutup ($0.160 - 0.164\text{ gf}^{-1}\text{d}^{-1}$). Tidak ada perbezaan pada perangkaan dalam pertumbuhan dan kemandirian dalam kepadatan antara kedua sistem. Daripada kajian ini, adalah disyorkan bahawa penggunaan sistem aliran air terbuka untuk pengkulturan juvana kerapu harimau mungkin lebih cekap berbanding sistem aliran air tertutup.

ACKNOWLEDGEMENTS

I would like to thank Associate Professor Dr. Che Roos Saad, chairman of my advisory committee, for providing me with a wonderful opportunity to complete my master study under his exceptional guidance. I feel very fortunate to have worked and studied under his direction. I appreciate his flexibility in playing the roles of advisor, teacher, friend, confidant, “shield”, statistical consultant, supervisor, complaint department, financier, editor, and countless other roles I have forgotten. Other than the provision of the necessary funding, this work would not have been possible without his patience, constant encouragement, guidance and knowledge.

I would like also to extend my most sincere gratitude and thanks to Professor Dr. Mohd Salleh Kamarudin as my co supervisor, for his constructive suggestions and guidance during the study period. I am also grateful for his willingness to serve on my committee, provide me assistance whenever required, involvement for reviewing this dissertation.

I extend special thanks to the head and staff of the Marine Finfish Production and Research Center (MAFPREC), Tanjung Demong Besut, Terengganu especially Mr Yusof and Mr Azlan for their support in this collaborative research project.

I would also like to extend my appreciation and thanks to my dear friends Mr Mahmoud Danaee and Hadi Zokaie Far, PhD candidate in UPM, who were very helpful during my study. My family for their love, understanding, encouragement

and moral support towards this achievement. Above all, to GOD almighty for making the study possible.

I certify that a Thesis Examination Committee has met on 16 January 2013 to conduct the final examination of Reza Salari on his thesis entitled "Growth Performance of Tiger Grouper Juveniles (*Epinephelus fuscoguttatus* Forsskål) with Varying Stocking Densities in Open Flow-Through and Closed Systems" in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U. (A) 106] 15 March 1998. The Committee recommends that the student be awarded the Master of Science.

Members of the Thesis Examination Committee were as follows:

Mihdzar bin Abdul Kadir, PhD

Associate Professor
Faculty of Agriculture
Universiti Putra Malaysia
(Chairman)

Aziz bin Arshad, PhD

Professor
