

**PRODUCTION OF CARBON NANOTUBES FOR GAS SENSOR
APPLICATION**

By

FAIZAH MD. YASIN

**Thesis Submitted to the School of Graduate Studies, Universiti Putra Malaysia,
in Fulfilment of the Requirement for the Degree of Master of Science**

June 2006

This work is dedicated

to

my beloved husband, Mohd. Rosdi Naim and all my sweethearts,

Sakinah, Kamilah, Izzati, Hanisah and Afifah.

Abstract of thesis presented to the Senate of Universiti Putra Malaysia in
fulfilment of the requirement for the degree of Master of Science

*PRODUCTION OF CARBON NANOTUBES FOR GAS SENSOR
APPLICATION*

By

FAIZAH MD YASIN

June 2006

Chairman : Fakhru'l-Razi Ahmadun, PhD

Faculty : Engineering

Gas sensors have a wide application in everyday life, whether in industry, medical, agriculture and environmental monitoring. A good sensor should be selective, sensitive, responsive, reliable and cost effective. Currently available gas sensors are lacking in one or more of these criteria. Therefore, there is a need to develop new sensing materials and technologies.

Carbon nanotubes have a potential to be developed as a new gas sensing material due to their inherent properties such as small, high strength, high electrical and thermal conductivity, and high specific surface area. As a result, it is possible to create a miniaturized sensor, which can lead to low power consumption, lighter and low cost.

This research was carried out to investigate the absorption effect of the following selected gases namely, carbon dioxide, ammonia, acetylene, natural gas and hydrogen towards the change of resistance of CNTs pellet as sensor signal. CNTs used in this research were synthesized by means of Floating Catalyst Chemical Vapor Deposition (FC-CVD) method. Benzene was used as a hydrocarbon source while ferrocene as a source of catalyst with Hydrogen and Argon as carrier and purge gas respectively.

From the research, it can be concluded that FC-CVD method produced high quality CNTs at temperature range of 750°C-850°C. CNTs show high sensitivity towards ammonia, acetylene and carbon dioxide at room temperature. Maximum increment in CNTs pellets' resistance upon exposure to ammonia, acetylene and carbon dioxide are 21.75, 26.53 and 18.91 respectively. However, for natural gas and hydrogen no detection was observed at room temperature. It is predicted that sensor activity can be enhanced by doping the CNTs and/or increasing the temperature of the sensing activity.

It is expected that many applications of CNT-based sensors will be explored in future as the interest of the nanotechnology research community in this field increases. However, CNTs have yet to overcome many technological barriers in order to fulfill their potential as the preferred material for sensor applications.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia
sebagai memenuhi keperluan untuk ijazah Sarjana Sains

**PENGHASILAN KARBON NANOTIUB UNTUK APLIKASI PENDERIA
GAS**

Oleh

FAIZAH MD YASIN

Jun 2006

Pengerusi : Fakhru'l-Razi Ahmadun, PhD

Fakulti : Kejuruteraan

Penderia gas digunakan dengan meluas di dalam kehidupan seharian, sama ada di dalam industri, perubatan, pertanian dan juga kawalan alam sekitar. Penderia yang baik mestilah mempunyai ciri-ciri berikut; selektif, sensitif, responsif, dan boleh diharap dengan harga yang berpatutan. Penderia gas yang ada di pasaran pada masakini tidak mempunyai kesemua kriteria-kriteria yang berkenaan. Oleh sebab itu, adalah menjadi keperluan untuk membangunkan teknologi dan bahan penderia yang baru.

Karbon nanotub berpotensi untuk dibangunkan sebagai bahan baru bagi penderia gas disebabkan oleh ciri-ciri inheren seperti bersaiz kecil, mempunyai kekuatan yang tinggi, konduktiviti elektrik dan haba yang tinggi serta luas permukaan spesifik yang besar. Oleh itu, adalah

berkemungkinan untuk menghasilkan penderia bersaiz miniatur, di mana ia boleh mengurangkan penggunaan tenaga, ringan dan juga lebih murah.

Kajian ini dijalankan untuk menyiasat kesan penyerapan gas-gas seperti; karbon dioksida (CO_2), amonia (NH_3), asetilena (C_2H_2), gas asli (metana) dan hidrogen (H_2) terhadap perubahan rintangan elektrik pelet karbon nanotiub sebagai isyarat penderia. Karbon nanotiub yang digunakan dalam kajian ini dihasilkan dari kaedah Pemendapan Wap Kimia bermangkin terapung. Benzena digunakan sebagai sumber hidrokarbon manakala ferrosin pula digunakan sebagai mangkin. Gas hidrogen dan gas argon masing-masing digunakan sebagai gas pembawa dan gas pembersih.

Kesimpulan yang dapat dibuat dari kajian ini ialah, kaedah Pemendapan Wap Kimia bermangkin terapung menghasilkan karbon nanotiub berkualiti tinggi pada lingkungan suhu 750°C - 850°C . Karbon nanotiub juga menunjukkan sensitiviti yang tinggi terhadap penyerapan gas ammonia, asetilena dan karbon dioksida pada suhu bilik. Kenaikan maksima rintangan elektrik pelet karbon nanotiub terhadap penyerapan gas ammonia, asetilena dan karbon dioksida masing-masing ialah 21.75, 26.53 dan 18.91. Walaubagaimanapun, bagi gas asli dan hidrogen, tiada sebarang perubahan dapat dikesan pada suhu bilik. Adalah diramalkan, aktiviti penderia dapat ditingkatkan dengan cara *doping* dan/atau meningkatkan suhu di mana aktiviti penderia dijalankan.

Adalah dijangkakan aplikasi-aplikasi penderia berdasarkan karbon nanotiub ini akan diekplorasikan lagi di masa depan kerana terdapat peningkatan kepentingan di dalam kajian nanoteknologi. Walaubagaimanapun, karbon nanotiub perlu mengatasi banyak halangan-halangan teknologi untuk memenuhi potensi sebagai bahan pilihan bagi aplikasi penderia.

ACKNOWLEDGEMENTS

I wish to express my profound gratitude and thanks to my supervisor Assoc. Prof. Dr. Fakhru'l-Razi Ahmadun for his guidance, enthusiastic supervision, encouragement and help throughout the duration of this research.

My deep appreciation and gratitude to Assoc. Prof. Dr. Iyuke Sunny Esayegbemu and Dr. Roslina Mohd Sidek for the numerous discussions and continued assistance throughout the research.

Special thanks go to my Head of Department, Assoc. Prof. Dr. Hajah Robiah Yunus for her understanding, help, suggestion and encouragement for the last few years.

I am also indebted to my colleague, my friends, and all the technicians for their encouragement, moral support and assistance throughout my graduate study.

Finally, special appreciation for my family; my understanding and supporting husband and my daughters whom continuous support and love had drive me forward.

I certify that an Examination Committee has met on 2nd June 2006 to conduct the final examination of Faizah Md Yasin on her Master of Science thesis entitled “Production of Carbon Nanotubes for Gas Sensor Application” in accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1980 and Universiti Pertanian Malaysia (Higher Degree) Regulations 1981. The Committee recommends that the candidate be awarded relevant degree. Members of the Examination Committee are as follows:

Robiah Yunus, PhD

Associate Professor
Faculty of Engineering
Universiti Putra Malaysia
(Chairman)

Luqman Chuah Abdullah, PhD

Associate Professor
Faculty of Engineering
Universiti Putra Malaysia
(Internal Examiner)

Suraya Abdul Rashid, PhD

Lecturer
Faculty of Engineering
Universiti Putra Malaysia
(Internal Examiner)

Ahmad Fauzi Ismail, PhD

Professor
Faculty of Chemical and Natural Resources Engineering
Universiti Teknologi Malaysia
(External Examiner)

HASANAH MOHD GHAZALI, PhD

Professor/Deputy Dean
School of Graduate Studies
Universiti Putra Malaysia

Date:

This thesis submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfilment of the requirement for the degree of Master of Science. The members of the Supervisory Committee are as follows:

Fakhrul-Razi Ahmadun, PhD

Associate Professor
Faculty of Engineering
Universiti Putra Malaysia
(Chairman)

Roslina Mohd. Sidek, PhD

Lecturer
Faculty of Engineering
Universiti Putra Malaysia
(Member)

AINI IDERIS, PhD

Professor/Dean
School of Graduate Studies
Universiti Putra Malaysia
