This thesis is dedicated to my parents and family.

Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfilment of the requirement for the degree of Master of Science

**DEVELOPMENT OF ORTHOPAEDIC OUTPATIENT CLINIC SCHEDULING INFORMATION SYSTEM FOR PERFORMANCE IMPROVEMENT**

By

**PAH PIN SHANG**

**May 2014**

**Chairman : Tang Sai Hong, PHD**  
**Faculty : Engineering**

Long patients' waiting time (PWT) and clinic overtime are common problems encountered in outpatient clinics. These usually occur in high demand clinics such as orthopaedics and cardiology. The Orthopaedic Specialist Outpatient Clinic of Hospital Serdang, Malaysia (OSOC) is facing same problems. In 2010, OSOC was successful in achieving its targeted average PWT, as prescribed in its Key Performance Index (KPI) in only three months of the year. The current study was conducted in OSOC with the aim of reducing PWT and overtime works of its staff through computer-based modelling and simulation. Problem areas requiring improvement include appointment system, resources allocation and patients flow. First, the processes in the OSOC were studied based on interviews, observation and research to ensure the system was well understood before the modelling commenced. Through this approach, the underlying causes within the system that contribute to long PWT were identified. Next, over a two-week period, data collections were performed in the clinic to obtain required data for modelling and simulation. Concurrently, additional patient data over the survey period were obtained from the OSOC. Based on these data, a computer model simulating the current operations within the OSOC, named "Current Orthopaedic Outpatient Clinic" (hereafter referred to as the "Current System") was generated using the SIMUL8 computer software package (SIMUL8 Corporation). Validation and verification of these outputs were conducted on Current System models to ensure the integrity and accuracy of the system and its input parameters. Furthermore, baseline benchmarks on several key performance indicators were obtained.

Through this process, the causes of current problems in OSOC were identified. Subsequently, a new computer simulated model, named "Improved System" was

generated in which the constraints identified within the Current System have been eliminated or modified. The KPI of the Improved System was next compared with that of the Current System to determine whether the implemented changes indeed result in improvement the performance of OSOC. To this end, sensitivity analyses were carried out to determine the responsiveness of the Improved System to the changes, such as number of appointments, “no-show” rate or forced booking.

Based on these simulations, these modifications would reduce the PWT significantly in the Improved System, compared with existing system. Furthermore, the entire simulated clinic sessions satisfied the criteria outlined in the clinic’s KPI. As an additional benefit, 90% of the clinic sessions simulated under Improved System’s parameters greatly improved clinic end time. In the sensitivity analyses, the new model demonstrates an ability to respond differently under various input parameters. In conclusion, the results of this study demonstrate that PWT in outpatient clinic can be significantly reduced by 53.7-97% after applying the improved settings revealed by computer-assisted modelling.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Master Sains

**PEMBANGUNAN SISTEM MAKLUMAT PENJADUALAN KLINIK  
ORTOPEDIK PESAKIT LUAR BAGI PENINGKATAN PRESTASI**

Oleh

**PAH PIN SHANG**

**Mei 2014**

**Pengerusi : Tang Sai Hong, PHD**  
**Fakulti : Kejuruteraan**

Tempoh penungguan pesakit (PWT) yang panjang dan kerja lebih masa merupakan masalah umum yang dihadapi oleh klinik-klinik rawatan pesakit luar. Masalah-masalah ini biasanya berlaku di klinik yang di bawah permintaan ramai seperti klinik ortopedik dan kardiologi. Klinik Kepakaran Ortopedik Rawatan Luar, Hospital Serdang, Malaysia (OSOC) turut mengalami masalah yang sama. Pada tahun 2010, OSOC telah berjaya mencapai purata PWT seperti yang dinyatakan dalam Indeks Prestasi Utama hanya dalam jangka masa tiga bulan. Kajian ini dijalankan di OSOC dengan tujuan mengurangkan tempoh penungguan pesakit (PWT) melalui sistem pemodelan dan simulasi berasaskan komputer. Antara masalah-masalah yang perlu diperbaiki termasuk sistem temujanji, peruntukan sumber dan aliran pesakit. Pertama, proses-proses dalam OSOC dikaji secara temuduga, pemerhatian dan penyelidikan bagi memastikan ia difahami sepenuhnya sebelum pemodelan dimulakan. Melalui kaedah ini, faktor-faktor asas dalam sistem tersebut yang menyebabkan penangguhan masa penungguan pesakit dikenal pasti. Seterusnya, pengutipan data dijalankan di dalam klinik selama dua minggu bagi memperoleh data-data yang diperlukan untuk pemodelan dan simulasi. Di samping itu, data-data tambahan pesakit semasa kajian juga diperoleh dari OSOC. Berdasarkan data-data ini, sebuah model komputer, dengan nama “Klinik Ortopedik Rawatan Luar Sedia Ada” (Selepas ini dirujuk sebagai “Sistem Sedia Ada”) dimodelkan melalui SIMUL8 (SIMUL8 Corporation) bagi mensimulasikan operasi terkini OSOC. Validasi dan verifikasi keluaran dijalankan melalui model sistem terkini bagi memastikan kejituan sistem dan parameter masukan. Selain itu, garis dasar penanda aras bagi beberapa petunjuk prestasi utama turut diperoleh.

Melalui proses ini, faktor-faktor masalah yang dihadapi OSOC dikenal pasti. Di samping itu, sebuah model simulasi komputer yang bernama “Sistem Diperbaiki” dimodelkan di mana batasan yang dikenalpasti melalui Sistem Sedia Ada diselesaikan atau diubahsuai. Petunjuk indeks prestasi Sistem Diperbaiki seterusnya dibandingkan dengan petunjuk indeks prestasi Sistem Sedia Ada bagi menentukan sama ada perubahan yang dilaksanakan membawa sebarang peningkatan terhadap prestasi OSOC. Bagi tujuan tersebut, analisis kepekaan turut dijalankan bagi mengenal pasti tindak balas sistem yang dicadangkan terhadap perubahan seperti nombor temujanji, kadar “ketidakhadiran” atau penempahan secara paksa.

Berdasarkan simulasi-simulasi ini, pengubahsuaian mampu mengurangkan PWT secara efektif dalam Sistem Diperbaiki berbanding dengan Sistem Sedia Ada. Tambahan pula, semua sesi perawatan yang disimulasi memenuhi garis panduan Indeks Prestasi Utama klinik. Sebagai kelebihan tambahan, 90% daripada sesi perawatan yang dimodelkan telah berjaya mengurangkan penangguhan masa penamatan. Dalam analisis kepekaan, model yang dicadangkan berjaya menunjukkan kebolehan untuk bertindak balas secara berbeza terhadap pelbagai perubahan dalam parameter masukan. Secara kesimpulan, hasil kajian ini menunjukkan bahawa PWT di klinik rawatan pesakit luar dapat dikurangkan secara 53.7-97.0% dengan mengaplikasikan penetapan yang diperbaiki melalui pemodelan dan simulasi berbantuan komputer.

## ACKNOWLEDGEMENTS

I would like to take this opportunity to express my sincere appreciation to all of the people who have provided encouragement, help and support during my Master process. First of all, I would like to thank my supervisor Associate Professor Dr. Tang Sai Hong for his inspirations, professional guidance, constructive comments and untiring support. He is the best mentor I have ever had during my journey in Universiti Putra Malaysia. I would not have achieved this far without his support and help.

I would like to express my thanks to my co-supervisor Associate Professor Dr. Manohar Arumugam for his interest in my proposal. His input into this thesis with his knowledge in healthcare was very helpful in guiding me into the right direction.

My sincere appreciation is also extended to Professor Dr. Rosnah Mohd Yusuff for her guidance, effort and encouragement throughout this research.

Moreover, I would like to thank Mr. Ang Kim Leong, manager of Clinical Research Centre, Hospital Serdang for assisting in getting approval for this thesis project. Besides, thanks for all cooperation and help from Orthopaedic Specialist Outpatient Clinic (OSOC) staff: Tuan Haji Ramli (Clinic Manager), Mr. Suhaimi (Assistant Clinic Manager) and all other staff in clinic. Without their help and support, I would not have completed this project successfully.

Also, thanks to Universiti Putra Malaysia for providing the funding (04-01-11-1175RU) for this project. The fund enables me to hire some students to run data collection in OSOC. In addition, I would like to thank Mr. Jim Holtman and Mr. Jorge Villacampa for their help in Simul8 software.

Finally, I would like to express my heartiest gratitude and appreciation to my family and all my friends who helped me throughout my research. With their company, my journey in Universiti Putra Malaysia has finally completed with a perfect ending.

I certify that a Thesis Examination Committee has met on 29<sup>th</sup> May 2014 to conduct the final examination of Pah Pin Shang on his thesis entitled “Development Of Orthopaedic Outpatient Clinic Scheduling Information System for Performance Improvement” in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The Committee recommends that the student be awarded the Master of Science

Members of the Thesis Examination Committee were as follows:

**Faieza binti Abdul Aziz, PhD**

Associate Professor  
Faculty of Engineering  
Universiti Putra Malaysia  
(Chairman)

**Mohd Khairol Anuar bin Mohd Ariffin, PhD**

Associate Professor  
Faculty of Engineering  
Universiti Putra Malaysia  
(Internal Examiner)

**Nuraini binti Abdul Aziz, PhD**

Senior Lecturer  
Faculty of Engineering  
Universiti Putra Malaysia  
(Internal Examiner)

**Shamsuddin Ahmed, PhD**

Associate Professor  
Universiti Malaya  
Malaysia  
(External Examiner)
