Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfillment of the requirement for the degree of Doctor of Philosophy

**PROPERTIES OF TITANIUM CARBIDE REINFORCED
ALUMINIUM SILICON ALLOY MATRIX**

By

M. SAYUTI

May 2012

Chairman : Professor Shamsuddin Sulaiman, PhD

Faculty : Engineering

Metal matrix composites are engineered materials which are a combination of two or more materials, one of which is a metal, whose tailored properties can be attained by systematic combination of different constituents. From a variety of methods available for producing these advanced materials, the conventional casting process is considered as the easiest processing technique. Preparation of these composite materials by foundry technology has the unique benefit of near-net shape fabrication in a simple and cost effective manner. Besides this, casting processes lend themselves to manufacture large number of complex shaped components of composites at a faster rate required by the automotive, aerospace, sports and other consumer oriented industries. Several methods have been developed to control the microstructure of composites during solidification including mechanical vibration, electromagnetic vibration, electromagnetic stirring and semi-solid processing. It is established that

mechanical mould vibration can significantly enhance the structure and properties of composites. In this study, titanium carbide particulate reinforced aluminium 11,8 wt% silicon alloy matrix composites were fabricated by carbon dioxide sand moulding process by varying the particulate addition by weight fraction on percentage basis using mechanical vibration mould. The influence of a wide range of vibration amplitudes and frequencies on the solidification kinetics, microstructure formation and mechanical properties of Titanium carbide reinforced aluminium 11,8 wt% silicon alloy were examined. Results show strong influence of mould vibration during solidification on the fabricated composites. The mechanical properties such as tensile strength, impact strength, surface hardness and physical properties such as density, thermal conductivity were significantly increased as a result of mould vibration. The maximum tensile strength is 141.125 MPa with vibration and 135.832 MPa without vibration. The maximum impact energy is 15.073 kJ with vibration and 14.514 kJ without vibration and hardness value based Rockwell superficial 15N-S scale is 85.88 for 2% without vibration and 86.08 with vibration. In addition, the change in microstructure and mechanical properties were successfully represented by the changes in solidification characteristics. Various vibration frequencies have reduced the lamellar spacing that changes the microstructure of the composites which as a result became more fibrous. The corresponding changes in mechanical properties indicate that ductility is more influenced by vibration than without vibration. The increase in ductility was believed to be due to the structural refinement.

Abstrak tesis dikemukakan kepada senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Doktor Falsafah

**CIRI TITANIUM KARBIDA DIPERKUKUH ALOI
ALUMINIUM SILIKON MatriK**

Oleh

M. SAYUTI

Mei 2012

Pengurus : **Profesor Shamsuddin Sulaiman, PhD**

Fakulti : **Kejuruteraan**

Komposit metal logam kejuruteraan bahan-bahan ini merupakan gabungan dua atau lebih bahan-bahan, satu daripadanya adalah logam yang ciri terbentuk boleh dicapai oleh gabungan sistematik dengan unsur-unsur yang berbeza. Dari pelbagai kaedah yang ada untuk menghasilkan bahan-bahan termaju ini, proses penuangan konvensional dianggap sebagai teknik pemrosesan yang paling mudah. Penyediaan bahan-bahan komposit oleh teknologi foundry mempunyai manfaat unik fabrikasi bentuk berhampiran dengan cara yang mudah dan kos yang berkesan. Di samping itu proses penuangan menjadikan ianya boleh mengeluarkan sejumlah besar komposit komponen kompleks pada kadar yang lebih cepat yang diperlukan oleh industri automotif, kapal terbang, sukan dan yang berorientasikan pengguna. Beberapa kaedah telah dibangunkan untuk mengawal mikrostruktur komposit semasa pemejalan termasuk getaran mekanikal, getaran elektromagnet, kacak elektromagnetik dan pemrosesan

separa pepejal. Ia dibentuk dimana getaran acuan mekanikal dengan ketara boleh meningkatkan struktur dan sifat-sifat komposit. Dalam kajian ini, titanium karbida zarah diperkukuh dalam silikon aluminium 11.8wt% komposit matriks aloi yang dibentuk oleh acuan karbon dioksida pasir dengan mengubah penambahan zarah oleh pecahan berat berdasarkan peratusan menggunakan acuan getaran mekanikal. Pengaruh pelbagai amplitud getaran dan frekuensi kinetik pemejalan, pembentukan mikrostruktur dan sifat-sifat mekanik zarah titanium karbida diperkukuh silikon aluminium 11.8wt% komposit matriks aloi telah diuji. Keputusan menunjukkan pengaruh yang kuat getaran acuan semasa pemejalan komposit yang direka. Sifat-sifat mekanikal seperti kekuatan tegangan, kekuatan hantaman, kekerasan permukaan dan sifat-sifat fizikal seperti kepadatan, kekonduksian terma dengan ketara meningkat akibat getaran acuan. Kekuatan tegangan maksimum iyalah 141.125 MPa dengan acuan getaran dan 135.832 MPa tanpa getaran. Kekuatan hantaman adalah 15.073 kJ dengan acuan getaran dan 14.514kJ tanpa getaran dan kekerasan Rockwell skala 15N-S adalah 85.88 untuk 2% tanpa getaran dan 86.08 dengan acuan getaran. Di samping itu, perubahan mikrostruktur dan sifat mekanik telah dihasilkan dengan jaya diwakili oleh perubahan dalam ciri-ciri pemejalan. Getaran pelbagai telah mengurangkan jarak lamela bahawa perubahan mikrostruktur komposit menjadi lebih bergentian. Perubahan yang sama dalam sifat-sifat mekanik menunjukkan bahawa kemuluran adalah lebih dipengaruhi oleh kekerapan getaran daripada tanpa getaran. Peningkatan dalam kemuluran dipercayai disebabkan oleh penghalusan struktur.

ACKNOWLEDGEMENTS

In the Name of Allah, Most Gracious and the Most Merciful. Alhamdulillah, with His blessing, I have completed this research and preparation of this thesis.

I would like to express my gratitude to my parents. Without the value of life they taught, I would not have reached this achievement. I am extremely thankful to my research supervisor and the chairman of my supervisory committee Professor Dr. Shamsuddin Sulaiman and my sincere appreciations are due to the members of the supervisory committee Dr. B. T. Hang Tuah bin Baharudin, Associate Professor Dr. Mohd Khairul Anuar Mohd Ariffin and Dr. Thoguluva Raghavan Vijayaram for their support in this research work and entire preparation of this doctoral thesis and I would like to convey my thanks to Mr. Ahmad Saifuddin Ismail, Foundry laboratories technician for his assistance during the entire period of my research project.

My acknowledgements are due to Malikussaleh University for financial support through Komisi Beasiswa Aceh (KBA) and Universiti Putra Malaysia for financial support through Graduate Research Fellowship (GRF), and also Research University Grant Scheme (RUGS).

Last but not the least, many thanks to my family for their love, patience, and understanding. I believe that their patience and encouragement has given me the perseverance to achieve my ambition.

APPROVAL

I certify that a Thesis Examination Committee has met on May 24, 2012 to conduct the final examination of M. Sayuti on his thesis entitled “Properties of Titanium Carbide Reinforced Aluminium Silicon Alloy Matrix” in accordance with the Universities and University College Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The committee recommends that the student be awarded the Doctor of Philosophy.

Members of the Thesis Examination Committee were as follows:

Tang Sai Hong, PhD

Associate Professor
Faculty of Engineering
Universiti Putra Malaysia
(Chairman)

Nafsiah Ismail, PhD

Professor Datin
Faculty of Engineering
Universiti Putra Malaysia
(Internal Examiner)

Faizal Mustapha, PhD

Associate Professor
Faculty of Engineering
Universiti Putra Malaysia
(Internal Examiner)

Mohammed Sarwar Jang Hashmi, PhD

Professor
Faculty of Engineering
Dublin City University
Ireland
(External Examiner)

SEOW HENG FONG, PhD

Professor and Deputy Dean
School of Graduate Studies
Universiti Putra Malaysia.

Date: 28 June 2012

This thesis was submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfillment of the requirement for the degree of Doctor of Philosophy. The Members of the Supervisory Committee were as follows:

Shamsuddin Sulaiman, PhD

Professor
Faculty of Engineering
Universiti Putra Malaysia
(Chairman)

Mohd Khairol Anuar Mohd Arifin, PhD

Associate Professor
Faculty of Engineering
Universiti Putra Malaysia
(Member)

B. T. Hang Tuah B. Baharudin, PhD

Senior Lecturer
Faculty of Engineering
Universiti Putra Malaysia
(Member)

Thoguluva Raghavan Vijayaram, PhD

Faculty of Engineering and Technology
Multimedia University, Melaka, Malaysia
(Member)

BUJANG KIM HUAT, PhD

Professor and Dean
School of Graduate Studies
Universiti Putra Malaysia.

Date:

DECLARATION

I declare that the thesis is my original work except for quotations and citations which have been duly acknowledged. I also declare that it has not been previously, and is not concurrently, submitted for any other degree at Universisiti Putra Malaysia or other institution.
