

Gross morphology of the stomach (proventriculus and ventriculus) of the edible bird's-nest swiftlet (*Aerodramus fuciphagus*) and house swift (*Apus nipalensis*)

ABSTRACT

This study was attempted to describe the gross anatomy of the stomach of Edible Bird's-Nest Swiftlet (*Aerodramus fuciphagus*). In addition, the comparison was made with the House Swift (*Apus nipalensis*). These two aerial insectivorous birds from Apodidae family are feed on similar flying insects group. The stomach of seven *Aerodramus fuciphagus* and six *Apus nipalensis* were dissected, examined, the weight and length were measured. The stomach of these two species of the birds comprises of proventriculus or pars glandularis, a glandular stomach and ventriculus or pars muscularis, a muscular stomach. The mean weight of the stomach of *Aerodramus fuciphagus* and *Apus nipalensis* were 0.39 ± 0.05 and 1.15 ± 0.08 g, respectively, while the mean length of the stomach of *Aerodramus fuciphagus* and *Apus nipalensis* were 2.87 ± 0.41 cm and 2.53 ± 0.19 cm, respectively. The relative weight of *Aerodramus fuciphagus* stomach (4.82 ± 0.43 g) was higher than the *Apus nipalensis* (4.30 ± 0.36 g) stomach, but the difference was not significant at $P < 0.05$. Interestingly, the relative length of stomach of *Aerodramus fuciphagus* (17.88 ± 2.26 mm) was found to be significantly higher than the *Apus nipalensis* (13.66 ± 0.35 mm) at $P < 0.05$. In conclusion, although the *Aerodramus fuciphagus* is smaller than the *Apus nipalensis* and these two insectivorous birds are grouped in the same family and consume similar diet, the stomach of *Aerodramus fuciphagus* is bigger than the *Apus nipalensis* relative to body weight.
