**Chairman: Associate Professor Mohamad Khazani Abdullah, Ph.D.**

**Faculty: Engineering**

Erbium doped fiber amplifiers and lasers have a great impact on optical communication due to their ideal advantages for the compensation of light energy during transmission through the fiber optic systems. This has been the focus of many research groups. Replacing the bottleneck electronic amplifier by the optical amplifier, a great improvement is made for the optical communication systems.

New configurations have been conceived and realized in this thesis. They have shown a great enhancement in amplifier and laser performance parameters. Several new configurations, for example double pass with filter which also supports multiple wavelengths, have been demonstrated and investigated.

The design and performance parameters of the new configurations are thoroughly characterized, showing an improvement in gain, noise figure,

output power flatness efficiency and side mode suppression ratio. Enhancement of results has been experimentally demonstrated, where a higher gain (56dB) and flat output power ( $<0.7\text{dB}$ ), a higher signal to noise ratio (77dB) and a higher efficiency (22%) are demonstrated.

Abstrak tesis yang dikemukakan kepada senat Universiti Putra Malaysia  
sebagai memenuhi keperluan untuk ijazah Doctor Falsafah

**MEREKACIPTA DAN MENGANALISA PEMBESAR FIBER TERDOPAN  
ERBIUM DAN LASER**

Pengganda gentian pendopan Erbium (EDFA) dan laser mempunyai impak yang besar di dalam komunikasi optik kerana kebaikannya yang dapat menggantikan tenaga cahaya semasa penghantaran melalui sistem gentian optik. Perkara ini telah difokuskan oleh banyak kumpulan penyelidikan. Dengan menggantikan pengganda elektronik dengan pengganda optikal, suatu penambahbaikan yang besar telah dapat dibuat di dalam sistem komunikasi optik.

Suatu konfigurasi baru telah di perkenalkan dan telah di realisasikan di dalam tesis ini. Dimana ianya merupakan suatu peningkatan yang besar didalam parameter prestasi pengganda dan laser. Beberapa konfigurasi baru tersebut adalah seperti double pass dengan penapis yang mana juga boleh menambung multiwavelength telah di analisa dan direalisasikan. Daripada parameter rekabentuk dan prestasi bagi konfigurasi yang baru ini telah

dikaji dan dianalisa dan ianya menunjukkan peningkatan didalam gandaan, tahap kebisingan, kecekapan kuasa keluaran mendatar dan SMSR. Keputusan yang menunjukkan peningkatan ini telah di tunjukan secara amali, dimana gandaan yang tinggi (56dB) dan keluaran kuasa mendatar(<0.7dB), mempunyai kadar isyarat kebisingan yang tinggi (77dB) dan kecekapan yang tinggi (22%).

## ACKNOWLEDGMENTS

Praise be to ALLAH the greatest, who has said:

“والله غالب على أمره ولكن أكثر الناس لا يعلمون”

First and foremost, I wish to express my deepest gratitude to my Associate Professor Dr Mohd Khazani Abdullah. I feel fortunate to have him as my adviser. His way of thinking, along with his brilliant ideas, deeply affects my thoughts on the scientific research. This work was possible because of his constant stimulation, keen vision and full support. I feel honored to have been a part of his research group for the past three years and I am sure that his example as both a teacher and a scientist will continue to inspire me and his future students.

I am also very grateful to Associate Professor Dr. Adzir Mahdi for sharing his years of experience and for his excellent collaboration. His inspiring discussion and valuable advice have made a good contribution to this thesis.

My special thanks go to all other members of photonic group, past and present, who helped me make my Ph.D. pursuit enjoyable and rewarding. My deepest appreciation is extended to my supervisory committee members: Professor Dr. Burhanuddin Mohd. Ali, Prof. Dr. Sahbudin Hj Shaari and Associate Professor Dr. Kaharudin Dimiyati. Also many thanks to follow Ph.D. Students: Malik, Suhairi, Zaini, Mohamed, and Master's students that I have

worked with: Aiman, Amang, Latif, Fairuz, Mohammed, Sham, Mansori and Tariq. Most of all, my deepest gratitude goes to my parents and my family for their unconditional patience, support and encouragement throughout the many years.

## LIST OF FIGURES

Figure	Page
1.1 Diagram of the experimental scheme shows: EDFA: erbium doped fiber amplifier; Bi-EDF: bismuth based EDF; Si-EDF: silica based EDF; SPSS: single pass single stage; SPDS: single pass dual-stage; DP: double pass; DSDP: dual stage double pass; TBF: tunable band pass filter and DWDM: dense wavelength division multiplexer.	1.12
1.2 Diagram illustrating the different schemes followed in the experimental demonstration of the laser phenomenon where; Bi-EDF: bismuth based erbium doped fiber, Si-EDF: silica based erbium doped fiber, FRL: fiber ring laser, LCFL: linear cavity fiber loop, DW: dual-wavelength. SW: single wavelength.	1.12
2.1 Experimental results of absorption cross-section vs wavelength of $\text{Er}^{3+}$ ion.	2.5
2.2 Schematic representation of the energy diagram without and with electron-host interaction.	2.6
2.3 Schematic representation shows the diagram of the three energy levels.	2.20
2.4 Schematic representation shows the diagram of the energy levels with stark split manifolds.	2.21
2.5 Experimental output power against pumping power at 40% and 90% output reflectivities.	2.26
2.6 Spectrum shows the laser output power vs the wavelength of the spectral width.	2.28
2.7 Experimental spectrum of optical signal showing the SMSR measurement.	2.31
3.1 ASE in single mode erbium doped fiber.	3.3
3.2 Dual-stage single pass EDFA using Si-EDF for the first stage and Bi-EDF for the second stage.	3.26
3.3 Single stage bi-directional EDFA using bismuth as a host.	3.27
3.4 The output ASE spectrum of the single pass configuration.	3.29

3.5	Experimental configuration of the broadband EDFA using double pass amplification.	3.29
3.6	The output ASE spectrum of the double pass configuration.	3.30
3.7	Experimental configuration of ring laser.	3.30
3.8	Experimental configuration of erbium doped fiber ring laser cavity used for dual wavelengths (classical configuration).	3.31
4.1	Diagram of the experimental scheme shows: EDFA: erbium doped fiber amplifier; Bi-EDF: bismuth based EDF; Si-EDF: silica based EDF; SPSS: single pass single stage; SPDS: single pass dual-stage.	4.1
4.2	Experimental configuration of the bi-directional pumping of Bi- EDF	4.8
4.3	FW, BW and BI pumping of the ASE.	4.9
4.4	Experimental net gain and NF versus pumping power for input signal power $P_{in} = -10$ dBm obtained using the FW, BW and Bi-directional pumping.	4.10
4.5	Experimental net gain and NF versus input pumping power for input signal power $P_{in} = -10$ dBm at $\lambda = 1550$ nm using bi-directional pumping (BI).	4.11
4.6	Experimental net gain vs pumping power for input signal power $P_{in} = -10$ dBm obtained at two different wavelengths with different configurations.	4.12
4.7	Experimental net gain vs output power for input signal power $P_{in} = -10$ dBm obtained at two wavelengths $\lambda = 1530$ nm ( $\square$ ), $\lambda = 1540$ nm and $\lambda = 1560$ nm ( $\Delta$ ).	4.13
4.8	Experimental net gain vs signal wavelength at different pumping power at $\lambda = 1550$ nm with $P_{in} = -10$ using bi-directional pumping (BI).	4.14
4.9	Bi-directional, backward, and forward pumping with input signal power $P_{in} = -12$ dBm.	4.15
4.10	Bi-directional pumping using input signal power $P_{sin} = -10$ dBm and pumping power $P_{p1} = P_{p2} = 130$ mW with $\lambda = 1532$ nm.	4.14
4.11	The bi-directional pumping (a) forward pumping (b) and backward pumping (c).	4.16

4.12	Forward pumping with and without input power signal.	4.18
5.13	Backward pumping with and without input signal.	4.19
4.14	ASE spectrum forward and backward pumping.	4.20
4.15	Signal input without pumping.	4.20
4.16	Forward, backward and bi-directional pumping with input signal power.	4.21
4.17	Experimental gain and NF vs pumping power at -12dBm input signal power and at different wavelength.	4.22
4.18	Experimental output power and NF vs the pump power at -12 dBm input signal power and at different wavelengths.	4.23
4.19	Optimum pump position for single pass amplifier at -10dBm input signal power.	4.24
4.20	Experimental gain vs input signal wavelength at different pumping power at -10dBm input signal power.	4.24
4.21	Experimental measure of the net gain against the output power at -10dBm input signal power.	4.25
4.22	Experimental configuration of SPDS-EDF amplifier.	4.26
4.23	Configuration showing the different power which existed in the system.	4.27
4.24	ASE of the Si-EDF and signal filtered after the first stage.	4.28
4.25	ASE flattened and signal filtered of SPDS-EDF.	4.29
4.26	Configuration showing the different power existed in the systems.	4.29
4.27	ASE flattened and signal filtered of DS-EDF the pump power $P_{p2}^+ = P_{p2}^- = 30$ mW and the $P_{p1}^- = 124$ mW.	4.30
4.28	ASE flattened and signal filtered of DS-EDF power $P_{p2}^+ = P_{p2}^- = 60$ mW and the $P_{p1}^- = 124$ mW.	4.31
4.29	ASE flattened and signal filtered of DS-EDF by decreasing the pump in the first stage.	4.31
