DEVELOPMENT OF AN EXPERIMENTAL FACILITY FOR MEASUREMENT OF TANGENTIAL JET FLOW IN A SUDDEN EXPANSION CHANNEL

By

IRFAN BIN ABD RAHIM

February 2006

Chairman: Abdul Aziz bin Jaafar, PhD

Faculty: Engineering

This thesis describes the development of an experimental facility of a tangential jet flow in a sudden expansion channel. The present study is intended to clarify experimentally the relation between flow and geometrical variables on the thermal development using a point wise temperature measurements technique. The temperature measurements have been conducted on a flat plate inside a low speed open circuit wind tunnel. The mainstream flow has a maximum of temperature 50°C. The temperature was controlled by a 10 kVA/40 Ampere voltage regulator. A maximum velocity, \( U_m \) at the mainstream intake is 10 m/s. The velocity on the coolant jet flow \( U_c \) is between 2 m/s to 8 m/s, the expansion ratio (ER) is 1.2 and the Reynolds numbers, \( Re_m \) is, \( 1.3 \times 10^5 \) on the mainstream location. The coolant distribution system is fabricated into three type of geometry: a slot shape 20 \( mm^2 / mm \), a square shape 10 mm x 10 mm and a circular shape 10 mm of diameter. The surface temperature in the direction of the jet flow media is evaluated based on
the measured temperatures, obtained through the thermocouples over the flat surfaces. The jet flow is tangentially injecting a jet of cooling air at an exit angle of 0° from the coolant distribution system to the plate surface. The test plate is made of plastic material (acrylonitrile butadiene styrene) plate of 10 mm thick flat plate which is installed on the channel wall and instrumented with a stream wise row of T-type thermocouples. The thermocouples are spaced 25.4 mm apart along the center line of the plate. The temperature ratio between the cooling air temperature \( (T_c) \) and the mainstream temperature \( (T_\infty) \) is in the range of \( 0.77 \leq \frac{T_c}{T_\infty} \leq 0.87 \) while the velocity ratio between the cooling velocity \( (U_c) \) and mainstream velocity \( (U_\infty) \) is in range of \( 0.2 \leq \frac{U_c}{U_\infty} \leq 0.7 \). From the observation made at the location \( \frac{X}{h} = 0.5 \), the cooling effectiveness \( (\eta) \) for tangential jet flow emanating from the slot, square and circular holes geometry, is to be at maximum value of 0.8, 0.6, and 0.5 respectively. The data presented here would be of interest to engineers to gain further understanding in the development of heat transfer due to tangential jet flow in a sudden expansion channel.
Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi sebahagian keperluan untuk ijazah Master Sains

PEMBANGUNAN SEBUAH KEMUDAHAN UJIKAJI UNTUK PENGUKURAN ALIRAN JET TANGEN DALAM ALUR PENGEMBANGAN MENDADAK

Oleh

IRFAN BIN ABD RAHIM

Februari 2006

Pengerusi: Abdul Aziz Bin Jaafar, PhD
Fakulti: Kejuruteraan

Tesis ini menerangkan pembangunan peralatan ujikaji untuk aliran jet tangen dalam alur pengembangan mendadak. Kajian ini lebih tertumpu untuk menjelaskan perhubungan antara aliran dan pelbagai bentuk geometri terhadap pembangunan haba dengan menggunakan teknik pengukuran suhu secara titik. Pengukuran suhu telah dijalankan ke atas plat rata didalam terowong angin litar terbuka berhalaju rendah. Arus aliran tersebut mempunyai bacaan suhu maximum 50°C dengan suhu dikawal oleh pembolehubah voltan 10 kVA/40 Ampere. Halaju maksimum \((U_m)\) arus pada salur masuk adalah 10 m/s. Halaju pada aliran jet \((U_t)\) adalah diantara 2 m/s hingga 8 m/s. Nisbah pengembangan \((ER)\) ialah 1.2 dan nombor Reynolds \((Re_o)\) bernilai \(1.3 \times 10^5\) pada lokasi arus. Sistem pengagihan pendiginan di fabrikasi kepada tiga jenis bentuk geometri: bentuk lubang alur 20 \(mm^2/mm\), bentuk segiempat sama 10 mm x 10 mm dan bentuk bulat berdiameter 10 mm. Suhu permukaan dalam arah aliran jet adalah dinilai berdasarkan suhu pengukuran yang
diambil menerusi pengganding suhu menerusi permukaan plat rata. Aliran jet disuntik kepada permukaan plat secara tangen pada sudut keluar 0° dari sistem pengagihan pendinginan. Plat ujian dibuat daripada bahan plastik (acrylonitrile butadiene stryrene) yang berukuran 10 mm tebal di mana plat ini dipasang pada saluran dinding dan dilengkapi dengan pengganding suhu jenis-T yang ditanam sepanjang plat rata tersebut. Setiap pengganding suhu dijarakan sebanyak 25.4 mm dibahagian tengah sepanjang plat tersebut. Nisbah suhu di antara suhu udara pendinginan \( T_i \) dan suhu aliran utama \( T_\infty \) adalah di dalam julat \( 0.77 \leq \frac{T_i}{T_\infty} \leq 0.87 \) manakala nisbah halaju di antara halaju pendinginan \( U_i \) dan halaju aliran utama \( U_\infty \) adalah didalam julat \( 0.2 \leq \frac{U_i}{U_\infty} \leq 0.7 \). Melalui pemerhatian yang dibuat pada lokasi \( X/h = 0.5 \) keberkesanan pendinginan \( (\eta) \) bagi aliran jet tangen yang mengalir dari lubang yang bergeometri masing-masing: lubang alur, lubang-lubang bergeometri segiempat sama dan lubang-lubang bergeometri bulat adalah pada nilai maksimum 0.8, 0.6 dan 0.5. Data yang dibandingkan di sini akan menarik minat para jurutera untuk lebih memahami dalam pembangunan pemindahan haba berdasarkan aliran jet tangen dalam alur pengembangan mendadak.
First and foremost, all praise and thanks giving to Allah the Almighty, for gracing me with strength to complete of my thesis. Alhamdullilah.

I am greatly indebted to my supervisor Dr Abdul Aziz Bin Jaafar for his guidance and friendship throughout my graduate work. He is very helpful and supportive and his continuous encouragement has made me work hard. Dr Abdul Aziz Bin Jaafar has been a continual source of inspiration and helped me to make the thesis a reality.

Much credit must also be given to committee members, Prof Madya Dr Megat Mohammad Hamdan Bin Megat Ahmad and Dr Abd Rahim Bin Abu Talib for their guidance, advice and encouragement throughout the completion of my thesis. To En Ropiee Bin Mat, I would like to extend special word of thanks for his support and guidance to provide valuable information during my thesis completion.

I am forever in debt to my parents for their dedication and continuous prayer throughout my whole life. Over the past years, their guidance, care and love has been undoubtedly indispensable. I would also like to acknowledge my beloved wife, Haryanti for her love, smiles and encouragement. Her warm support and company has helped me through the difficult time. Word is not sufficed to express it. To my little hero, Mohd Izzudin Al-Qasimi you always make me busy at home. All tiredness during work will disappear when I see your smile and laughter. I would also like to express my appreciation towards my family, relatives and member at aerodynamics lab. Special thanks to Prof Ir. Dr. Shahnor bin Basri for his motivation.
I certify that an Examination Committee met on 10\textsuperscript{th} February 2006 to conduct the final examination of Irfan Bin Abd Rahim on his Master of Science thesis entitled “Development of an Experimental Facility for Measurement of Tangential Jet Flow in a Sudden Expansion Channel” in accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1980 and Universiti Pertanian Malaysia (Higher Degree) Regulations 1981. The Committee recommends that the candidate be awarded the relevant degree. Members of the Examination Committee are as follows:

**Ir Nor Mariah bte Adam, PhD**  
Associate Professor  
Faculty of Engineering  
Universiti Putra Malaysia  
(Chairman)

**Ahmad Samsuri bin Mokhtar, PhD**  
Lecturer  
Faculty of Engineering,  
Universiti Putra Malaysia  
(Internal Examiner)

**Ir Sapuan bin Salit, PhD**  
Associate Professor  
Faculty of Engineering,  
Universiti Putra Malaysia  
(Internal Examiner)

**Waqar bin Asrar, PhD**  
Professor  
Kulliyyah of Engineering  
International Islamic Universiti Malaysia  
(External Examiner)

$Pr_t$ Prandtl number, $Pr = \frac{c\mu}{k}$

PE potential energy

$q$ dynamic pressure $(P_t - P_s)$

$q^*$ heat flux (W/m$^2$)

$q_0^*$ local heat flux (W/m$^2$)

$Q_{in}$ heat transfer of the energy into the system

$Q_{out}$ heat transfer of the energy out the system

$R$ electrical resistance ($\Omega$)

$R_{1,2,3,4,5}$ electrical resistance ($\Omega$)

$R_{T1,T2}$ total electrical resistance ($\Omega$)

xxiii
R  
  gas constant for air (J/kg.K)

Re  
  Reynolds number, $Re = \frac{\rho ud}{\mu}$

Re,  
  Reynolds number based on hole diameter, $Re = \frac{U_m d}{v_\infty}$

Re,  
  Reynolds number based on slot, $Re = \frac{U_m d}{v_\infty}$

Re,  
  Reynolds number based on mainstream velocity, $Re = \frac{U_m (H - h)}{v_\infty}$

Ri  
  Bouyancy parameter,

RS  
  RS Component

s  
  step

S  
  duct local parameter

S  
  separation between the injection hole

St,  
  Stanton number, $\left( \frac{Nu_i}{Re Pr} = \frac{h}{\rho V_c} \right)$

$T_\infty$  
  mainstream flow temperature (°C)

$T_0$  
  starting temperature reading (°C)

$T_{a,b,c,d}$  
  thermocouple probe (T-type)

$T_f$  
  film temperature (°C)

$T_s$  
  surface temperature (°C)

$T_c$  
  cooling flow temperature (°C)

$T_w$  
  wall temperature (°C)

T  
  absolute temperature (°C or °K)
