CHARACTERISATION, CLASSIFICATION AND
SUITABILITY FOR OIL PALM OF SOME COMMON SOILS
IN TAWAU-SEMPORNA AREA, SABAH

By

ARIF SUGANDI

Thesis Submitted to the School of Graduate Studies, Universiti Putra Malaysia
In Fulfilment of the Requirements for the Degree of
Master of Agricultural Science

April 2005
Seven most common soils on different parent materials from oil palm estates in Tawau-Semporna area, Sabah were selected for this study. The study was carried out due to the lack of detailed information for proper classification and management of the soils. The objectives are therefore to determine their physical, chemical, mineralogical and micromorphological properties; to classify them according to the FAO/UNESCO Legend, the Sabah Classification System, the World Reference Base (WRB) and the Soil Taxonomy and to compare the usefulness of these different systems; and to evaluate their fertility status and suitability for oil palm.

All the soils have deep solum (>100 cm) and oxic or argillic horizons. Soil color and texture vary depending on the parent materials. Bulk density of andesitic soils is lower than the rest of the soils.
Soil pH of the soils are acidic (<5.0) and have a net negative charge. Except for the andesitic basalt soil, the studied soils have mainly low amount of bases and capacity exchange cation (CEC). Soil N, P and K are also mostly low. Soil Mg is high on the andesitic basalt and tuffaceous sedimentary rocks soils. For oil palm cultivation, the soils are of low to very low fertility.

Most of the studied soils are highly weathered due to the dominance of kaolinite, quartz, goethite, hematite and gibbsite. Andesitic basalt and tuffaceous sedimentary rock soils are however less weathered as indicated by the presence of 2:1 clay minerals, illite and feldspars. The most interesting mineralogical and micromorphological anomaly is the presence of cristobalite in the soils over sedimentary rocks indicating the volcanic influence on the soils through the addition of volcanic ash and by the presence of tuffaceous materials.

The studied soils are classified into different soil types according to the various classification systems indicating each soil have specific properties. The classification of soils according to the WRB systems appears to give more detailed information and better interpretation on soil properties and management than the FAO/UNESCO legend and Soil Taxonomy.

Based on the Fertility Capability Classification, the studied soils are classified into different fertility groups with major problems of low CEC, Al toxicity and K deficiency. No major constraint is encountered on the andesitic basalt soil due to its
Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Master Sains Pertanian

PENCIRIAN, PENGELASAN DAN KESESUAIAN UNTUK KELAPA SAWIT BEBERAPA JENIS TANAH DI TAWAU-SEMPORNA, SABAH

Oleh

ARIF SUGANDI

April 2005

Pengerusi : Profesor Madya Siti Zauyah Darus, PhD

Fakulti : Pertanian

Kesemua tanah mempunyai solum yang dalam (>100 cm) dan horizon oksik atau argilik. Warna dan tekstur tanah berbeza bergantung kepada bahan induk tanah tersebut. Ketumpatan pukal tanah yang terbentuk daripada andesitik adalah rendah.

Tanah-tanah ini mempunyai kadar luluhawa yang tinggi kerana mengandungi mineral kaolinit, kuarsa, goetit, hematite dan gibsit. Tanah basalt andesitik dan tanah endapan bertuff mempunyai kadar luluhawa yang kurang tinggi ditunjukkan oleh kehadiran lempung jenis 2:1, mika dan feldspar. Ciri-ciri mineralogi dan mikromorfologi yang menarik adalah kehadiran kristobalit pada tanah endapan menunjukkan pengaruh bahkan volkanik dalam tanah tersebut.

Kajian pengelasan menurut Fertillity Capability Classification (FCC) menunjukkan bahawa tanah-tanah tersebut mempunyai pengelasan yang berbeza. Masalah kesuburan yang paling utama ialah nilai KPK yang rendah, ketoksikan Al dan
kekurangan K. Tiada masalah pada tanah basalt andesit kerana tahap kesuburannya yang lebih tinggi. Kajian analisa cluster menunjukkan tanah-tanah pada kajian ini berkumpulan sesuai dengan jenis bahan induk.

Kajian ini menunjukkan bahwa pedologi, pengelasan dan kesesuaian tanah adalah sangat penting untuk mengetahui sifat-sifat dan kesesuaian tanah sebenar untuk tanaman. Kajian serupa adalah sangat berguna dan harus dilakukan untuk jenis tanah yang lain di Malaysia.
ACKNOWLEDGEMENTS

In the name of Allah the Most Merciful and Most Compassionate. Praise is to Allah SWT for giving His help and guidance throughout my study.

First and foremost, I am indebted to my supervisor, Assoc. Prof. Dr Siti Zauyah Darus, Department of Land Management, Faculty of Agriculture, UPM, for her supervision, advice, guidance, understanding, encouragement and constructive criticism throughout the study.

I am also grateful to the members of my supervisory committee, Assoc. Prof. Dr. Che Fauziah Ishak and Assoc. Prof. Dr. Anuar Rahim at the Department of Land Management, Faculty of Agriculture, UPM, for their valuable comments and suggestions. And a special thank to Assoc. Prof. Dr. Rosenani Abu Bakar as a chairman of the Examination Committee for her constructive ideas.

My sincere gratitude is also extended to the Board of Directors of Applied Agricultural Resources (AAR) Sdn. Bhd., Sungai Buloh, Malaysia, for giving me the opportunity, funding and support throughout my study at Universiti Putra Malaysia. I would like to especially thank to Dr Soh Aik Chin, Head of Agriculture Research and Mr Goh Kah Joo, Principal Research Officer at AAR Sdn. Bhd. for their continuous support, advice and encouragement. My appreciation also goes to all colleagues and staff of AAR Sdn. Bhd.
My deepest gratitude goes to my beloved wife, Ari Sulistyoo Rini, and children, Ariski Myardi and Aristy Aleeya, parents and all family members for their prayer and support during my study.

Finally, I am indebted to a lot of people who helped me throughout this study, particularly Bpk Edy Yatno, Mr Abayneh Esayas and Pn. Siti of AAR Sdn. Bhd.

May Allah reward them for their good deeds, Amin.
I certify that an Examination Committee met on 18th April 2005 to conduct the final examination of Arif Sugandi on his Master of Agricultural Science thesis entitled “Characterization and Classification of Soils in Tawau-Semporna Area, Sabah and their Suitability for Oil Palm” in accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1980 and Universiti Pertanian Malaysia (Higher Degree) Regulations 1981. The Committee recommends that the candidate be awarded the relevant degree. Members of the Examination Committee are as follows:

**Rosenani Abu Bakar, PhD**
Associate Professor
Faculty of Agriculture
Universiti Putra Malaysia
(Chairman)

**Shamsuddin Jusop, PhD**
Professor
Faculty of Agriculture
Universiti Putra Malaysia
(Internal Examiner)

**Hamdan Jol, PhD**
Associate Professor
Faculty of Agriculture
Universiti Putra Malaysia
(Internal Examiner)

**Abdul Rashid Ahmad, PhD**
Associate Professor
Faculty of Science
Universiti Malaya
(External Examiner)
