EFFECT OF AZADIRACHTA INDICA EXTRACT ON HEPATOCARCINOGENESIS-INDUCED RATS

By

MANAL MOHAMED ELHASSAN TAHA

Thesis Submitted to the School of Graduate Studies, Universiti Putra Malaysia, in Fulfilment of the Requirement for the Degree of Master of Science.

February 2007
DEDICATION

Specially dedicated to,

My beloved parents, husband, sisters Manahil and Sarah, brother Ahmed, daughter Roa, supervisors

For their invaluable support, love, patience and intellectual stimulation.............
Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfilment of the requirement for the degree of Master of Science.

EFFECT OF AZADIRACHTA INDICA EXTRACT ON HEPATOCARCINOGENESIS-INDUCED RATS

By

MANAL MOHAMED ELHASSAN TAHA

February 2007

Chairman: Associate Professor Fauziah Othman, PhD

Faculty: Medicine and Health Sciences

The effects of 5% *A. indica* aqueous extract (AI), or more commonly as Neem, on hepatocarcinogenesis induced *Sprague-Dawley* male rats were investigated. Hepatocarcinogenesis was induced in rats by employing a two carcinogen system: an intraperitoneal injection of 200 mg/kg diethyl nitrosamine (DEN) as initiator; followed by 0.02% of 2-acetylaminofluorene (AAF) in rat chow for two weeks to promote carcinogenesis. The rats were then left for two weeks to allow hepatic preneoplastic lesions to occur. The plant extract was prepared in 5% w/v in distilled water. Fresh leaves were collected, blended and mixed with distilled water. Twenty male rats *Sprague-Dawley* weighing 150-250g, were acclimatized for 1 week before use. The rats were divided into four groups of five rats each.
The groups were: DEN/AAF-induced rats (C), DEN/AAF-induced rats treated with 5% *A. indica* (CAI), normal control rats (N) and normal rats treated with 5% *A. indica* extract group (NAI). The rats in group N and NAI were not induced with cancer however were injected once intraperitoneally with corn oil and act as normal control. The plant extract was fed to CAI and NAI groups to study its effects on both cancer and normal groups, respectively.

In this study several parameters were evaluated as means of determining the effects of AI on DEN/AAF-induced hepatocarcinogenesis in rats. Body and liver weight profiles, foremost, hepatic lesions were scored in rats induced with DEN/AAF carcinogens especially in the portal and lobular regions of the liver sections examined for histology. Loss of normal cell organization was also observed once the hepatocarcinogenesis was induced. In addition to histological observations, the TUNEL Assay, liver antioxidant enzyme Glutathione S-transferase (GS-T), Glutathione Peroxidase (GPx) in the serum and liver, tumor marker alpha-fetoprotein (AFP) in serum and molecular detection of AFP and albumin genes expressions were conducted. The observation of the lesion scoring have shown significant difference (p<0.05) between DEN/AAF and normal control groups (N, NAI). Histologically there were significant changes in the lesion scoring of the liver in portal and lobular region in DEN/AAF induced.
group (C) compared to the DEN/AAF treated with *A. indica* (CAI). TUNEL assay supported that there was more numbers of apoptotic cells in the liver of (CAI) group compared to (C) group. The liver enzymes (GST & GPx) activity was measured and the result for both glutathione S-transferase and glutathione peroxidase were significantly (*p*<0.05) higher in the (C) compared to the other groups (CAI, N, NAI). This result revealed that *A. indica* extract could reduce the activity of liver and serum GPx and GST enzymes of rats during hepatocarcinogenesis. However, the results of body and liver weight profiles showed that the CAI group was not significantly different (*p*>0.05) from N, C and NAI groups.

Alpha fetoprotein (AFP), a notable liver tumor marker, level was measured. The DEN/AAF induced group (C) showed the highest increase in AFP levels while in CAI group illustrated significant (*p*<0.05) decrease in AFP level. There was no significant (*p*>0.05) difference between N, NAI and CAI group.

Molecular detection of gene expression was done by RT-PCR for *α*-fetoprotein and albumin specific genes. However, the expression of the AFP gene was observed only in DEN/AAF induced group (C). Albumin gene expression was observed in all the study groups C, N, NAI and CAI proving the hepatic nature
of the studied tissue and used as a housekeeping control gene in the RT-PCR experiments.

As a conclusion, *A. indica* (Neem) has revealed a chemopreventive capability by regressing the hepatacarcinogenesis induced by DEN/AAF carcinogens. This capability can be seen from the modulating effects of the plant in the biological indicators used in this study which can encourage the researchers to consider the *A. indica* (Neem) for further on mechanism and toxicology study.
Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Master Sains.

KESAN EKSTRAK AZADIRACHTA INDICA TERHADAP TIKUS ARUHAN HEPATOKARSINOGENESIS

Oleh

MANAL MOHAMED ELHASSAN TAHA

Februari 2007

Pengerusi: Profesor Madya Fauziah Othman, PhD

Fakulti: Perubatan dan Sains Kesihatan

Kesan 5% larutan ekstrak akuas A. indica (AI) atau lebih di kenali sebagai Neem pada hepatokarsinogenesis terhadap tikus jantan Sprague-Dawley telah dikaji. Hepatokarsinogenesis telah diaruh pada tikus menggunakan dua sistem karcinogen, melalui suntikan 200 mg/kg diethylnitrosamine (DEN) secara intraperitoneal sebagai pencetus hepatocarcinogenesis dan diikuti dengan memberikan makanan yang dicampurkan dengan 2-acetylaminofluorene (0.02% AAF) sebagai 'promoter' hepatokarsinogenesis selama 2 minggu. Ekstrak tumbuhan disediakan di dalam air suling pada kepekatan 5% w/v. Daun tumbuhan tersebut dikumpul, dikisar dan dicampurkan bersama air. 20 tikus jantan Spraque Dawley, 150g–250g diaklimatisaskan selama satu minggu sebelum diujikaji. Tikus tersebut dibahagikan kepada empat kumpulan dengan
lima ekor tifus setiap kumpulan. Kumpulan tersbut ahila: tikus yang diaruh dengan DEN/AAF (C), tikus yang diaruh dengan DEN/AAF dirawat dengan 5% A. indica (AI), tikus kewalan normal (N) dan tikus normal yang dirawat dengan 5% ekstark A. indica (NAI). Tikus kumpulan N dan NAI tidak diaruhkan dengan kanser tetapi disuntik secara intraperitonial dengan minyak jagung dan dijadikan sebagai kawalan. Ekstrak tumbuhan tersebut diberikan kepada kumpulan CAI dan NAI untuk dikaji kesannya terhadap kumpulan kanser dan normal.

Dalam kajian ini, beberapa parameter telah ditentukan sebagai purata untuk menentukan kesan bagi AI terhadap DEN/AAF yang memyebabkan hepatokarsinogenesis pada tikus. Profil berat dan hati, selain itu, kesan hati telah dikira dalam tifus disuntik dengan bahan karsinogen DEN/AAF terutama dalam kawasan portal dan lobular hati telah dikaji dalam pemeriksaan histologi. Kehilangan organisasi pada sel normal juga telah ditihat apabila karsinogenesis diaruh. Pemeriksaan histologi juga telah dijalankan menggunakan asai TUNEL, enzim antioksida hati Glutathione S-transferase (GST), Glutathione peroxidase (GPx) di dalam serum dan hati, penanda tumor alpha-fetoprotein (AFP) di dalam serum dan pengesananan molekular AFP dan ekspresi gen albumin juga telah dijalankan. Pemerhatian terhadap ujian skor...
kesan menunjukkan perbezaan yang signifikan (p≤0.05) di antara DEN/AAF dan kumpulan kawalan normal (N, NAI). Pemeriksaan histologi menunjukkan perubahan pada ujian skor kesan hati dalam kawasan portal pada kumpulan aruhan DEN/AAF (C) berbanding dengan DEN/AAF yang dirawat dengan A. indica (CAI). Asai TUNEL mengukuhkan bahawa terdapat beberapa sel apoptotic di dalam hati kumpulan CAI berbanding kumpulan C. Aktiviti enzim hati (GST & GPx) diukur dan keputusan bagi kedua glutathione S-transferase and glutathione peroxidase adalah berbeza secara signifikan pada aras keertian (p<0.05) di antara kumpulan kanser (C) dan kumpulan rawatan (CAI, N, NAI). Keputusan ini menunjukkan A.indica mampu mengurangkan aktiviti enzim hati dan serum GST dan GPx pada tikus semasa hepatokarsinogenesis. Walau bagaimanapun keputusan profil berat jisim tubuh dan hati menunjukkan kumpulan CAI tidak memberikan perbezaan yang signifikan pada aras keertian (p > 0.05) daripada kumpulan N, C dan NAI.

Aras alpha fetoprotein (AFP) telah diukur sebagai penanda pertumbuhan sel kanser hati. Kumpulan DEN/AAF (C) menunjukkan peningkatan aras AFP yang tertinggi, manakala kumpulan CAI menunjukkan penurunan yang signifikan pada aras keertian (p < 0.05) pada aras AFP. Namun tiada perbezaan yang signifikan (p > 0.05) di antara kumpulan N, NAI dan CAI.
Pengesahan secara molecular ke atas ekspresi gen telah dilakukan menggunakan RT-PCR ke atas gen spesifik α-fetoprotein dan albumin. Tetapi, ekspresi gen AFP hanya dapat dilihat dalam kumpulan yang diaruh dengan DEN/AAF (C). Ekspresi gen albumin diperhatikan dalam kumpulan kajian C, N, NAI dan CAI yang membuktikan sifat semulajadi hepatic pada organ yang dikaji dan pembersih gene kawalan dalam uji kaji RT-PCR.

Kesimpulannya, *A. indica* (Neem) telah dinyatakan sebagai kemopreventif untuk penyakit hepatokarsinogenesis yang diaruhkan oleh bahan karsinogen DEN/AAF. Keupayaan ini boleh dilihat melalui kesan tumbuhan dalam penunujuk biologi yang digunakan dalam kajian ini dimana akan menggalakkan penyelidik *A. indica* (Neem) untuk mempertimbangkan mekanisma dan toksikologi yang akan datang.
ACKNOWLEDGEMENTS

First my praise to Almighty Allah for giving me the power and will to complete this study and peace be upon his final Prophet and Messenger Mohamed.

I would like to convey sincere gratitude to Associate Professor Dr. Fauziah Othman the Chairman of my Supervisor Committee for her invaluable advice, guidance, constant support and encouragement. I would like to extend my grateful thanks and appreciation to the members of my Supervisory Committee Associate Professor Dr. Patimah Ismail and Dr. Parichehr Hanachi for their constructive suggestion, advice and support throughout the course of this study.

I gratefully acknowledge the "Malaysian Technical Co-operation Programme (MTCP) for giving me this opportunity and for their financial support for my Master programme.

I am gratefully thanking all the staff of Faculty of Medicine and Health Science and Institute of Bioscience for their constant assistance and friendship.

It is worth to mention my colleagues and friends from Sudanese community in UPM and Serdang area for their friendship and companion. Finally yet
importantly, I would like to extend my sincere appreciation to my husband Siddig Ibrahim and my daughter Roa for their patience, sacrifices and moral support during the course of the study.
I certify that an Examination Committee has met on 26th February 2007 to conduct the final examination of Manal Mohamed Elhassan Taha on her Master of Science thesis entitled "Effect of *Azadirachta indica* Extract on Hepatocarcinogenesis-Induced Rats" in accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1980 and Universiti Pertanian Malaysia (Higher Degree) Regulations 1981. The Committee recommends that the candidate be awarded the relevant degree. Members of the Examination Committee are as follows:

**Abdul Hamid Abdul Rashid, PhD**  
Professor  
Faculty of Medicine and Health Sciences  
Universiti Putra Malaysia  
(Chairman)

**Chong Pei Pei, PhD**  
Lecturer  
Faculty of Medicine and Health Sciences  
Universiti Putra Malaysia  
(Internal Examiner)

**Abdah Md. Akim, PhD**  
Lecturer  
Faculty of Medicine and Health Sciences  
Universiti Putra Malaysia  
(Internal Examiner)

**Azimatol Hawariah Lope Pihie, PhD**  
Professor  
Faculty of Science and Technology  
Universiti Kebangsan Malaysia  
(External Examiner)

HASANAH MOHD. GHAZALI, PhD  
Professor/Deputy Dean  
School of Graduate Studies  
Universiti Putra Malaysia  
Date: 17 MAY 2007
This thesis submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfilment of the requirement for the degree of Master of Science. The members of the Supervisory Committee are as follows:

Fauziah Othman, PhD
Associate Professor
Faculty of Medicine and Health Sciences
Universiti Putra Malaysia
(Chairman)

Patimah Ismail, PhD
Associate Professor
Faculty of Medicine and Health Sciences
Universiti Putra Malaysia
(Member)

Parichehr Hanachi, PhD
Department of Biomedical Sciences
Alzahra Research Centre
Tehran, Iran
(Member)

AINI IDERIS, PhD
Professor/Dean
School of Graduate Studies
Universiti Putra Malaysia

Date: 14 JUNE 2007
DECLARATION

I hereby declare that the thesis is based on my original work except for quotations and citations which have been duly acknowledged. I also declare that it has not been previously or concurrently submitted for any other degree at UPM or other institutions.
