Chairman: Professor Kamariah Abu Bakar, Ph.D.
Faculty: Educational Studies

The Smart School Project was implemented in 1999. It aims to systematically reinvent the teaching and learning processes in schools to produce not only knowledgeable and IT-literate students but also self-regulated learners. However, many teachers may not realize the factors related to self-regulated learning. There are needs to uncover these factors as this information may assist teachers in promoting self-regulation in smart schools. In addition, students may not be able to self-regulate their studies efficiently as they are accustomed to the conventional teacher-centered way of learning. Therefore, they need a Self-Management Tool that can guide them to employ self-regulated learning strategies constantly and practically. This tool may improve students' self-regulated learning skills and enable them to manage their studies more efficiently in smart schools. The objective of this study, thus, was twofold. It aimed to identify the predictors of self-regulated learning in secondary smart schools and also to examine the effectiveness of the Self-Management Tool in improving self-regulated learning.

A quantitative correlational research design was used to determine the predictors of self-regulated learning. The sample consisted of 409 students, from six randomly chosen smart schools. The data were collected through survey method. Multiple regression analysis showed that levels of IT-integration, student-teacher interactions, motivational beliefs, and self-regulative knowledge were significant predictors of self-regulated learning [$\Delta R^2 = .51$, $F(5, 403) = 84.48$, $p < .01$].

A quasi-experimental design was employed to test the effectiveness of the Self-Management Tool in improving self-regulated learning. The subjects were taken from a randomly chosen secondary smart school. A total of 61 students were involved; 30 students in the experimental group and 31 students in the control group. After three months of treatment, Analysis of Covariance (ANCOVA) revealed that there seemed to be no true difference in self-regulated learning between the two groups, [$F(1, 56) = 2.39$, $p > .05$]. However, eight weeks after that, the experimental group's self-regulated learning was found to be significantly higher than the control group, [$F(1, 55) = 31.04$, $p < .01$]. This suggests that the Self-Management Tool was effective in improving students' self-regulated learning.

**PERAMAL PEMBELAJARAN ATURAN KENDIRI DI SEKOLAH-
SEKOLAH MENENGAH BESTARI DAN KEBERKESANAN ALAT
PENGURUSAN DIRI DALAM MENINGKATKAN
PEMBELAJARAN ATURAN KENDIRI**

Oleh

Pengerusi: Profesor Kamariah Abu Bakar, Ph.D.
Fackulti: Pengajian Pendidikan

Projek Sekolah Bestari dilaksanakan pada tahun 1999. Ia bermatlamat untuk merombak proses pengajaran dan pembelajaran di sekolah demi melahirkan pelajar yang bukan sahaja berpengetahuan dan celik teknologi maklumat tetapi juga berkemahiran dalam pembelajaran aturan sendiri. Namun, kebanyakan guru mungkin tidak mempunyai pengetahuan tentang faktor-faktor yang berkaitan dengan pembelajaran aturan sendiri. Faktor-faktor ini perlu dikenalpasti kerana maklumat ini boleh membantu guru meningkatkan pembelajaran aturan sendiri di sekolah bestari. Selain daripada itu, pelajar mungkin tidak mampu menguruskan pembelajaran mereka dengan cekap kerana mereka sudah biasa dengan kaedah pembelajaran yang berfokuskan guru. Justeru itu, pelajar memerlukan sebuah Alat Pengurusan Diri yang dapat membimbing mereka menggunakan strategi-strategi pembelajaran secara kerap dan praktikal. Alat tersebut mungkin boleh memperbaiki kemahiran pembelajaran aturan sendiri di kalangan pelajar dan membolehkan mereka menguruskan pelajaran dengan lebih efektif di sekolah bestari. Oleh itu, kajian tersebut mempunyai dua objektif; ia bertujuan untuk

mengenalpasti peramal pembelajaran aturan sendiri di sekolah menengah bestari dan juga menyelidiki keberkesanan Alat Pengurusan Diri dalam memperbaiki pembelajaran aturan sendiri.

Kajian berbentuk kuantitatif kolelasi digunakan untuk mengenalpasti peramal-peramal pembelajaran aturan sendiri. Sampel kajian terdiri daripada 409 pelajar, dari enam buah sekolah bestari yang terpilih secara rawak. Data kajian dikumpul melalui kaedah soal selidik. Keputusan analisis regresi berganda menunjukkan bahawa tahap integrasi teknologi, interaksi antara pelajar dengan guru, kepercayaan motivasi dan pengetahuan tentang strategi pembelajaran merupakan peramal pembelajaran aturan sendiri yang signifikan [$\Delta R^2 = .51$, $F(5, 403) = 84.48$, $p < .01$].

Reka bentuk eksperimen-quasi digunakan untuk menguji keberkesanan Alat Pengurusan Diri dalam meningkatkan pembelajaran aturan sendiri. Subjek kajian diambil daripada sebuah sekolah menengah bestari yang terpilih secara rawak. Seramai 61 orang pelajar terlibat; 30 orang pelajar dalam kumpulan eksperimen dan 31 orang pelajar dalam kumpulan kawalan. *Analisis Kovarians* (ANCOVA) menunjukkan bahawa tiada perbezaan signifikan dalam pembelajaran aturan sendiri antara kedua-dua kumpulan tersebut selepas kajian tamat, [$F(1, 56) = 2.39$, $p > .05$]. Namun, lapan minggu selepas itu, kumpulan eksperimen didapati mempunyai pembelajaran aturan sendiri yang lebih tinggi secara signifikan daripada kumpulan kawalan, [$F(1, 55) = 31.04$, $p < .01$]. Ini menunjukkan bahawa Alat Pengurusan Diri berkesan dalam meningkatkan pembelajaran aturan sendiri di kalangan pelajar.

ACKNOWLEDGEMENTS

Many people have contributed significantly to this research and each is remembered gratefully. The expression of my gratitude are not mere protocols and empty reflections of professional etiquette, they are sincerely felt. I would like to thank the following:

Professor Dr. Kamariah Abu Bakar, Dr. Samsilah Roslan, Dr. Wong Su Luan, and Associate Professor Dr. Petri Zabariah Megat Abd Rahman, my supervisors, for their guidance, constructive criticisms, understandings, and moral supports. They have monitored and guided my research work professionally. Without their help this study would not have taken off the ground so speedily. No words can sufficiently express the extent I am indebted to them.

All the panel of experts, Associate Professor Dr. Bahaman Abu Saman, Professor Dr. Suradi Salim, Dr. Mariani Md. Nor, Dr. Lihanna Borhan, Professor Dr. Datin Noran Fauziah Yaakub, Madam Yan Poh Gan, Encik Mak Heng Poi, Puan Maimunah Kassim, and Puan Siti Dahlia Dallip, for their assistance in instruments development and validation. Their insights and experiences have indeed improved the credibility of the research instruments.

The language experts, Encik Murshidi Harun, Puan Ruhaizah Marzuki and Madam Loh Ev-onne, for their help in translating and assessing the instruments.

Puan Zainafsiah Hj. Zakariah, for her involvement in the experimental study. Without her cooperation and commitment, I would not be able to successfully

complete the research according to schedule. Her enthusiasm to teach and to educate her students has also inspired me to be a better teacher.

The principals and teachers of Sekolah Menengah Kebangsaan Dato' Dol Said, Sekolah Menengah Sains Muar, Sekolah Menengah Sains Muzaffar Shah, Sekolah Menengah Kebangsaan Dato Sri Amar Di Raja, Sekolah Menengah Kebangsaan Seri Bintang Utara, Sekolah Menengah Kebangsaan Putrajaya, Kolej Tunku Kursiah, Sekolah Menengah Alam Shah Putrajaya, Sekolah Menengah Kebangsaan Abdullah Munshi, Sekolah Menengah Sains Pokok Sena, and Sekolah Menengah Tun Fatimah, for their help and cooperation, which had smoothed the mechanics of data collection. The students, for their willingness to be involved in the study, which has made the administration of the survey a pleasure.

University of Science Malaysia, for granting me a scholarship to complete my doctorate degree. This financial support is much appreciated as it allowed me to conduct the research on a full time basis.

My family, for their prayers, kindness, love, and support.

My friends and colleagues at the School of Education, University of Science Malaysia, who had contributed in one way or another.

To all from whom I have received intellectual assistance during my educational span.

CHAPTER I

INTRODUCTION

Background of the Study

Self-regulation is one of the most intriguing areas in human studies because people are always fascinated with the understanding of how individuals seek to control their own physical, behavioral and psychological qualities. In order to understand this psychological construct, numerous studies have been carried out by researchers in various fields ranging from health care (Walshe, 2003; Richard, Reinhardt & Elias, 2002), management (Dawn & Boyce, 2003) to education (Wolters, 2003; Benson, 2001). Research on self-regulation is currently focusing on education pertaining to learning and academic achievement processes.

Studies on self-regulated learning have grown out of more general efforts to investigate students' learning. Research during the past 30 years on students' learning has progressively included emphases on cognitive strategies, metacognition, motivation, task engagement, and student-centered learning. Self-regulated learning emerged as a construct that encompassed these various aspects of academic learning and provided more holistic view of the learning strategies, motivation and knowledge that students acquire.

Generally, self-regulated learning describes how learners metacognitively, motivationally and behaviorally promote their own academic achievement (Zimmerman, 1986). Metacognitively, self-regulated learners plan, organize, self-monitor, and self-evaluate at various stages of the learning processes. Motivationally, self-regulated learners perceived themselves as competent, self-efficacious, autonomous and they work hard to achieve their academic goals. Behaviorally, self-regulated learners select, structure, and even create environments that optimize learning. According to researchers, self-regulated learning is reflected by the usage of self-regulated learning strategies. These strategies include rehearsal, elaboration, organization, critical thinking, metacognitive self-regulation, time and environment management, effort regulation, peer learning as well as help seeking (Pintrich, Smith, Gracia, & McKeachie, 1991).

Self-regulated learners are characterized as active learners who efficiently manage their own learning. They start by analyzing task requirements, defining performance criteria, and setting learning goals. These steps are critical because learners make decisions about how to self-regulate learning based on perceived task demands. Next, self-regulated learners identify strategies likely to accomplish their objectives. This entails selecting and adapting strategies to match task demands. Finally, self-regulated learners implement strategies, monitor outcomes associated with strategy use, make judgments about task performance and adjust strategies based on the success of their efforts.

Self-regulated learning is a vital skill in IT-integrated learning environment. Its importance became evident after the recent explosion of Information Technology (IT). There is now substantial body of research showing that learning in IT-integrated environment is an active and constructive process (De Corte, 1990). Students are not passive receptacles of information, but actively construct their own knowledge and skills through interactions with the environments. In such settings, students are required to complete many assignments, projects, and folios independently, hence competency in self-regulated learning plays an important role in determining the success of learning.

IT can promote self-regulated learning as it provides students with tools such as personal computers, educational software, and Internet that support and enhance self-learning. Learning became more student-centered, independent and exploratory in nature. Kenning (1996) for example, asserts that the Internet is strongly supportive of self-regulated learning as learners can study whenever they want using a potentially unlimited range of authentic materials. They can also converse quite easily with experts in various fields or seek information from other students around the world. In this information age, no doubt, the Internet is an essential source of information for students. While it has always been imperative for students to learn how to select, organize, and evaluate information, it is even more so now. About 35,000 websites are created every four hours, making the Internet a vast, yet potentially confusing resource for students ("Guide Students to Use the Net," 2003). Therefore, teachers have to teach students how to manage information, which is obtained from
