## **MEASUREMENT AND MODELING OF HAND GRIP STRENGTH AND ENDURANCE OF MALAYSIAN FEMALE**

By

**NOR HADZFIZAH BINTI MOHD RADİ**

**January 2015**

**Chair: Y.M. Raja Mohd Kamil bin Raja Ahmad, PhD, Ir**

**Faculty: Engineering**

Gripping is an important physical activity in daily routine. The capability of muscular force during gripping can be evaluated in terms of Hand grip Strength (HGS) and Hand grip Endurance (HGE). There are two types of movements that are associated with HGE which are dynamic or repetitive (HGE<sub>d</sub>) and static (HGE<sub>s</sub>) movements. In the literature, there are many studies which have been performed to investigate the relationship between demographics and hand anthropometric dimensions factors with HGS. These factors have been used as predictive factor for rehabilitation and recovery. However there is lack of studies showing the relationship combined of demographics and hand anthropometric dimensions to HGE which are important factors in hand rehabilitation and recovery. The aim of this project is to develop predictive model of young female HGS and HGE based on the demographic and hand anthropometric collected. Thus, the specific objectives of this study are; (1) to develop an optimal grip size electronic hand grip strength measuring system that records and analyze the HGS and HGE time series signals, (2) to determine the correlation between demographic and hand anthropometric dimensions, and the HGS as well as HGE of young Malaysian female, and (3) to develop an intelligent predictive model of HGS and HGE. There are three assessments in evaluating the HGS, HGE<sub>d</sub> and HGE<sub>s</sub>: single-repetition, 20-repetition and 30-seconds static hold. In addition 6 demographics and 9 hand anthropometrics data are recorded from each volunteer in order to investigate the correlation between HGS, HGE<sub>d</sub> and HGE<sub>s</sub> and these data. By using all the associated data, the predictive model of HGS, HGE<sub>d</sub> and HGE<sub>s</sub> are developed using Adaptive Neuro Fuzzy Inference System (ANFIS) model. In this study 45 females of the age group 18 to 30 years were recruited. The assessment of grip strength and endurance was measured using the fabricated hand grip measuring device and followed the American Society of Hand Therapy (ASHT) protocols of seating to maintain the consistency of each volunteer's measurement. By comparing with similar study performed on western

population, the results show that the female HGS in this study is much higher probably due to optimal grip size of the fabricated measuring device. Meanwhile for HGE<sub>d</sub> and HGE<sub>s</sub>, these measurements are lower and it is found that the hand dominant was significantly stronger than non-hand dominant for HGS, HGE<sub>d</sub> and HGE<sub>s</sub>. In addition the HGS was correlated with weight, Body Mass Index (BMI), hand breadth across thumb, wrist thickness and wrist circumference. Meanwhile HGE<sub>d</sub> and HGE<sub>s</sub> were correlated with age and occupation but not correlated with any of the hand anthropometric dimensions. Non-parametric predictive model based on ANFIS is used to develop the predictive HGS and HE model. In developing predictive ANFIS modeling, the input selection was executed and the most significant inputs with respect to HGS, HGE<sub>d</sub> and HGE<sub>s</sub> for both hands are obtained. In ANFIS model, there is small discrepancy between actual and predicted average output for training and checking datasets. Nevertheless, this study has shown that ANFIS can be potentially used as an effective predictive model with larger dataset.

## **PENGUKURAN DAN PEMODELAN KEKUATAN GENGGRAMAN DAN DAYA TAHAN TANGAN DIKALANGAN WANITA MALAYSIA**

Oleh

**NOR HADZFIZAH BINTI MOHD RADI**

Januari 2015

**Pengerusi: Y.M. Raja Kamil bin Raja Ahmad, PhD, Ir**

**Fakulti: Kejuruteraan**

Genggaman adalah aktiviti fizikal yang penting dalam kehidupan seharian. Kebolehan ketahanan otot semasa menggenggam boleh dinilai dalam terma Kekuatan Genggaman Tangan (HGS) dan Daya Tahan Tangan (HGE). Pergerakan HGE terbahagi kepada dua jenis iaitu pergerakan dinamik atau perulangan (HGE<sub>d</sub>) dan statik (HGE<sub>s</sub>). Dalam literatur, banyak kajian telah dibuat untuk mengkaji hubungkait antara faktor demografi dan antropometri tangan dengan HGS, yang merupakan sebagai faktor ramalan untuk rehabilitasi dan pemulihan. Namun, terdapat kekurangan kajian yang menunjukkan hubungkait antara gabungan demografi dan antropometri tangan dengan HGE, yang juga boleh diambil kira sebagai faktor penting dalam rehabilitasi tangan dan pemulihan. Matlamat projek ini adalah untuk membina model ramalan bagi HGS dan HGE di kalangan wanita muda berasaskan demografi dan antropometri tangan yang direkodkan. Oleh itu, objektif kajian ini adalah; (1) untuk membangunkan sistem pengukuran dan merekodkan kekuatan genggaman tangan elektronik yang mempunyai saiz yang optimal dan dapat menganalisis HGS dan HGE dalam isyarat masa siri, (2) untuk menentukan korelasi antara demografi dan antropometri tangan dengan HGS serta HGE di kalangan remaja wanita di Malaysia, dan (3) untuk membangunkan model ramalan pintar HGS dan HGE. Terdapat tiga penilaian dalam menilai HGS, HGE<sub>d</sub> dan HGE<sub>s</sub>: pengulangan tunggal, 20-pengulangan dan 30 saat memegang statik. Di samping itu 9 data demografi dan 15 data antropometri tangan direkodkan dari setiap sukarelawan untuk menyiasat hubungan antara HGS, HGE<sub>d</sub> dan HGE<sub>s</sub> dengan data tersebut. Dengan menggunakan semua data yang berkaitan, model ramalan HGS, HGE<sub>d</sub> dan HGE<sub>s</sub> dibangunkan dengan menggunakan model Adaptive Neuro Fuzzy Inference System (ANFIS). Kajian ini mengambil 45 sukarelawan wanita bagi kumpulan umur 18 hingga 30 tahun. Penilaian kekuatan genggaman dan daya tahan diukur menggunakan alat pengukur yang direka dan mengikuti protokol cara duduk oleh America Society of Hand Therapy (ASHT) untuk mengekalkan

keseragaman data setiap sukarelawan. Dengan membandingkan kajian yang sama dilakukan ke atas penduduk barat, pengukuran HGS dalam kajian ini menunjukkan lebih tinggi ini berkemungkinan kerana saiz alat pengukur yang optimal. Manakala bagi HGE<sub>d</sub> dan HGE<sub>s</sub>, pengukuran ini adalah lebih rendah dan didapati tangan yang dominan adalah jauh lebih kuat daripada tangan bukan dominan untuk HGS, HGE<sub>d</sub> dan HGE<sub>s</sub>. Dalam korelasi didapati HGS mempunyai korelasi dengan berat badan, Index Jisim Badan (BMI), lebar tangan termasuk ibu jari, ketebalan pergelangan tangan dan lilitan pergelangan tangan. Manakala HGE<sub>d</sub> and HGE<sub>s</sub> mempunyai kolerasi dengan umur dan pekerjaan langsung tiada kaitan dengan dimensi anthropometri tangan. Model ramalan non-parametrik berdasarkan ANFIS digunakan untuk membangunkan model bagi HGS dan HGE. Dalam membangunkan model ramalan ANFIS, pilihan input dilaksanakan dan input yang paling signifikan dengan HGS, HGE<sub>d</sub> dan HGE<sub>s</sub> untuk kedua-dua tangan diperolehi. Dalam model ANFIS, terdapat perbezaan kecil di antara keluaran purata sebenar dengan keluaran purata ramalan bagi kedua-dua set data untuk latihan dan periksa. Walau bagaimanapun, kajian ini telah menunjukkan bahawa ANFIS berpotensi digunakan sebagai model ramalan yang efektif dengan dataset yang lebih besar.

## ACKNOWLEDGEMENTS

First of foremost I would like to thank Allah s.w.t. for giving me the patience and blessing to complete my master.

I am extremely grateful to my supervisor, Ir. Dr. Raja Mohd Kamil bin Raja Ahmad for his time, ideas and stimulating support during the course of my research work at Universiti Putra Malaysia (UPM). I really appreciate his concerns and advice, which had kept me going. I also would like to thank my co-supervisor, Dr. Siti Anom binti Ahmad for her support and concern during my research.

Not to forget, a lot of thanks to Mr. Wildan Ilyas from Strength of Material Lab, Department of Mechanical and Manufacturing Engineering, UPM for his favor in handling the calibration process.

I am grateful to my husband, Ahmad Dainney bin Zainuddin, for his help in upbringing our kids, Diya Medina and Umar Madani, during my busy days. My deepest gratitude goes to my parents, Ayah, Mohd Radi bin Saat and Mak, Maznah binti Abas for their moral support has encouraged me to complete my research. And not to forget my siblings, thank you so much.

Finally, I would like to thank the Universiti Malaysia Pahang (UMP) and Ministry of Higher Education Malaysia (MOHE) for financial sponsorship during my study.

I certify that a Thesis Examination Committee has met on 30 January 2015 to conduct the final examination of Nor Hadzfizah binti Mohd Radi on her thesis entitled "Measurement and Modeling of Hand Grip Strength and Endurance of Malaysian Female" in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The Committee recommends that the student be awarded the Master of Science.

Members of the Thesis Examination Committee were as follows:

**Nurul Amziah binti Md Yunus, PhD**

Senior Lecturer  
Faculty of Engineering  
Universiti Putra Malaysia  
(Chairman)

**Nasri bin Sulaiman, PhD**

Senior Lecturer  
Faculty of Engineering  
Universiti Putra Malaysia  
(Internal Examiner)

**Abd. Rahman bin Ramli, PhD**

Associate Professor  
Faculty of Engineering  
Universiti Putra Malaysia  
(Internal Examiner)

**Mohd Zarhamdy bin Md Zain, PhD**

Associate Professor  
Universiti Teknologi Malaysia  
Malaysia  
(External Examiner)

## CHAPTER 1

### INTRODUCTION

#### 1.1 Background

The anatomy of the hand is complicated and interesting. Its uniqueness is absolutely essential for our daily routine. The function of upper limb especially the hand in normal human daily activity includes light activity such as opening a door by squeezing the doorknob, and heavy activity such as lifting heavy box and transporting it to another place. Hand functions are classified into prehensile (grasping or gripping) and non-prehensile (non-grasp) like pushing and lifting (Napier, 1956). Of all human physical activities none is more important than gripping that generally employs a combination of hand-wrist-forearm movements (Adams, 2006; Imrhan, 2006).

Gripping is one of the hand activities that involves the movement of approximately 35 muscles in the forearm and hand. During gripping activities, the muscles of the flexor mechanism in the hand and forearm create grip strength while the extensors of the forearm stabilize the wrist (Waldo, 1996). There are two types of gripping namely, power grip and precision grip. For the power grip, the object is pressed against the palm of the hand for the generation of force by the fingers and thumb (Napier, 1956) as depicted in Figure 1.1(a). For the precision grip, the object is manipulated between the thumb and the fingertips in a fine movement without the involvement of the palm (Napier, 1956) as depicted in Figure 1.1(b). Power grip is commonly used as an index to assess impairment and treatment outcome of hand function (Talsania and Kozin, 1998).

(a)

(b)

**Figure 1.1. Example of gripping. (a) Power grip. (b) Precision grip.**  
(Source: Napier, 1956)

The capability of muscular force during power grip can be evaluated in terms of Hand grip Strength (HGS) and Hand grip Endurance (HGE). The HGS is typically examining maximum force during a single repetition. Meanwhile the HGE is examining activities that refers to the ability of maintaining a constant desired force over time (Nicolay and Walker, 2005). There are two types of movements that are associated with HGE which are dynamic or repetitive (HGE<sub>d</sub>) and static (HGE<sub>s</sub>) movements. An example of HGE<sub>d</sub> is typing using the typewriter, while carrying a furniture is an example for HGE<sub>s</sub>.

It is important to study both HGS and HGE due to the increasing prevalence of Cumulative Trauma Disorders (CTD's) such as carpal tunnel syndrome, strained muscle, tendonitis, rheumatoid arthritis and many others. Evaluation of HGS and HGE may help to identify individuals at risk of CTDs and improvement of treatment and rehabilitation processes (Robertson et al., 1996). In addition, due to the importance of gripping in many daily activities, HGS is often used in several fields for example, in medical, as an indicator of overall physical strength and health (Boissy et al., 1999; Chilima and Ismail, 2001; Pieterse et al., 2002; Massy-Westropp et al., 2004; Kaburagi et al., 2011) and medical therapy for rehabilitation and recovery (Bohannon, 2001) as well as sports that involves hand performance such as tennis and weightlifting (Fry et al., 2006; Lucki and Nicolay, 2007). The information of HGS can also be used in designing ergonomic hand tools (Nicolay and Walker, 2005; Imrhan, 2006). Other study that focuses on women health, states that normal grip strength is highly related to normal bone mineral density in postmenopausal women (Kärkkäinen et al., 2009) and they suggest that grip strength is a potential screening tool for women at risk of osteoporosis (Di Monaco et al., 2000).

## **1.2 Problem Statements**

There are many studies which have been done to investigate the correlation of socio-demographic variables, for example, age, gender, BMI, occupation and ethnics with hand grip strength (Nicolay and Walker, 2005; Bandyopadhyay, 2008; Koley and Singh, 2009; Wu et al., 2009). Similar studies on factors that influenced hand grip strength, which are, hand dominance, gender, occupation, height and weight have also been done on Malaysian population, (Kamarul et al., 2006b; Moy et al., 2011; Hossain et al., 2012). Comparing the studies between Asian and Western populations indicate the studies using Western based data do not necessarily applies to Malaysian population as reported (Kamarul et al., 2006a).

Those studies concluded that Western norm of hand grip strength measurement were different to the Asian people, since the hand dimension of Asian were slightly smaller that Westerners. Furthermore there are many studies which have been done to check the relationship such as demographic factors with HGS. This has been used as a predictive factor for rehabilitation and recovery. However there is lack of evidence showing the relationship of

demographics and hand anthropometric dimensions to HGE which is considered to be factors for hand rehabilitation and recovery. And to narrow down, there is lack of study for Malaysian population that has been done to investigate the influences of demographic hand anthropometric dimensions to HGS and HGE.

Hence, the need of study arises due to the lack of study in Malaysian population. This study is conducted to investigate two main points. Firstly is the relationship between HGS and demographic data as well as anthropometric of hand dimensions. The second study is the relationship between HGE and demographic data as well as anthropometric of hand dimensions. And this study is constrained to Malaysian women population only. In the process of this investigation the hand grip strength, hand gripping system is designed for Asian hand size. In addition, the HGS and HGE data analysis for Malaysian population are compared with the Western population based study.

This study is useful for post hand surgery rehabilitation tracking. For example, a carpal tunnel syndrome patient will undergo rehabilitation process to regain their grip strength and endurance back to his or her original level. However the actual level cannot be determined since the patient whom admitted for surgery has a compromised hand function. Due to that motivation, there need such model of HGS and HGE to predict his or her normal level of grip strength based on Asian population.

### **1.3 Objectives**

By referring to the problems explained in Section 1.2, this research focuses on developing models that can be used to predict HGS and HGE using demographic and hand anthropometric dimensions information of young Malaysian female.

The objectives of the research are listed as follows:

- 1) To develop a electronic hand grip strength measuring system that records and analyze the HGS and HGE time series signals.
- 2) To determine the correlation between demographic and hand anthropometric dimensions, and the HGS as well as HGE of young Malaysian female.
- 3) To develop an intelligent predictive model of HGS and HGE.

## 1.4 Scope

The scope of the research includes the recruitment of selected 45 female volunteers with age mean of  $22.40 \pm 3.71$  years. Volunteers were taken from students and staff of the Electrical and Electronic Engineering Faculty, Universiti Malaysia Pahang. This group of volunteers is assumed to represent young Malaysian female population. The inclusion and exclusion criteria in recruiting the volunteers are listed as follows:

Inclusion criteria:

- i. Normal healthy female volunteer in age group of 18 to 30 years. (Which was assessed by questionnaire SF-36)
- ii. Volunteer with right hand dominance or left hand dominance. (Dominant hand is defined as the preferred hand used in daily activity like writing, eating and handling heavy objects).

Exclusion criteria:

- i. any history of hand, forearm, elbow or shoulder problems
- ii. any injury to upper extremity

After considering the inclusion and exclusion criteria, volunteers' HGS and HGE were assessed for both hands. The device which is designed for the assessment fulfills the criteria of optimal grip span sizes which can produce maximal grip strength. This device is linked to the designed Graphic User Interface (GUI) that records grip force applied versus time. During the assessment, volunteers followed the data collection protocol outlined by American Society of Hand Therapist (ASHT).

There are several assumptions that have been made during the experiments. Firstly, the volunteers exerted maximum effort during all tests. Then, the testing environment was sufficiently stable to rule out any effect due to factors such as room temperature and lighting. Lastly an adjustable chair is assumed comfortable for all volunteers to alter the seat height to accommodate their different size.

## 1.5 Thesis Outline

This thesis is divided into six main chapters that are organized as follows. In Chapter 1, introductory which includes the background, problem statement, objectives and scope of the research are presented. Literature reviews related to this research are covered in Chapter 2. Chapter 3 presents the development of hand grip strength and endurance measuring system. In this section the

description of the related hardware components and the software designed to carry out the experiment are presented. Next, the details of data collection process, analysis of the data and the development of the intelligent predictive model are presented in Chapter 4. Chapter 5 presents the result of the correlation and discusses the performance analysis of ANFIS predictive model. Lastly, the conclusion of this project and some recommendations for future work are discussed in Chapter 6.
