**Chairman: Professor Jamilah Bt. Bakar, PhD**

**Faculty: Food Science and Technology**

Corn-based snacks are generally well accepted but low in protein content due to the limited protein-based ingredient incorporated in the formulations. This is because the common extrusion technology used to produce the snack is basically developed for starch-based dough formulation. Incorporating fish protein in the formulation could result in several problems relating to extrusion condition, textural properties and the stability of the snack itself. Therefore, in order to overcome these constraints, the present study was aimed at developing a nutritious puffed corn-fish snack by (i) enhancing the nutrition value and texture of the snack (ii) optimizing the extrusion conditions for enhanced textural properties (iii) and evaluating the storage stability of the developed snack. Extruded puffed corn-fish snack was produced from corn grits containing 0 to 30% of Silver carp (*Hypophthalmichthys molitrix*). This was followed by

optimizing the composition of the snack using Response Surface Methodology. The optimum formulation was obtained at 85% corn and 15% fish. Improvement of textural characteristics of the puffed corn-fish snack was studied by nucleating materials (calcium carbonate, magnesium silicate, sodium bicarbonate and bran) which were incorporated at 1 to 2% for the first three nucleating agents and at 5 and 10% for bran. The results showed that all nucleating agents significantly enhanced the texture of the puffed snack except for bran. Among the four studied nucleating agents, magnesium silicate at 0.5% was the best texture modifier. Microstructure of the puffed corn-fish snack, which was examined by Scanning Electron Microscope showed that the air cell diameter in the snack which containing 0.5% of magnesium silicate was reduced 7.32 times while the number of cells per unit area was increased 4.76 times compared to the control. In order to optimize the extrusion conditions, RSM experimental design was performed. The optimum extrusion condition was determined to be at 116°C, 1107 g/min feed rate and 148 rpm screw speed. Storage stability of the developed snack both unseasoned and seasoned packed in Biaxillary Poly Propylene films were studied over a storage period of 30 weeks. Microbial conditions were evaluated at 0, 15 and 30 weeks of storage while chemical and sensory parameters were carried out at six weeks intervals for 30 weeks. It is concluded that the shelf-stable, nutritious crispy puffed corn-fish snack containing 15% fish, 84.5% corn and 0.5% magnesium silicate (w/w)

can be produced, packed under air atmosphere conditions with metalized BOPP and well accepted for a storage period of 28 weeks.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Doktor Falsafah

**PEMBENTUKKAN SNEK JAGUNG-IKAN DARIPADA IKAN KAP PERAK (*HYPOPHthalmICTHYS MOLITRIX*) DENGAN MENGGUNAKAN TEKNIK PENYEMPERITAN.**

Oleh

**Pengerusi: Professor Jamilah Bt. Bakar, PhD**

**Fakulti: Sains dan Teknologi Makanan**

Snek berasaskan jagung secara umumnya diterima baik tetapi kandungannya yang rendah protein disebabkan oleh bahan-bahan terhad yang berasaskan protein telah ditambah dalam formulanya. Ini semua adalah kerana teknologi penonjolan yang biasa digunakan untuk menghasilkan snek adalah secara asasnya dibangunkan untuk formula doh yang berasaskan kanji. Mencampurkan protein ikan dalam formula tersebut menyebabkan beberapa masalah yang berkaitan dengan keadaan penonjolan, sifat tekstual dan kestabilan snek itu sendiri. Oleh yang sedemikian, dalam usaha mengatasi kekangan ini, kajian ini bertujuan untuk membangunkan snek jagung –ikan yang berkhasiat dengan (i) meningkatkan nilai nutrisi dan tekstur snek (ii) mengoptimumkan proses

penonjolan untuk memperbaiki sifat tekstur (iii) dan menilai kestabilan bagi penyimpanan snek yang telah dibangunkan tersebut. Snek jagung-ikan yang penuh khasiat telah dihasilkan daripada tepung jagung mengandungi 0 hingga 30% isi ikan kap perak (*Hypophthalmichthys molitrix*). Ini diikuti pula dengan mengoptimumkan komposisi snek menggunakan Metodologi Respon Permukaan. Formula optimum telah diperolehi pada 85% jagung dan 15% ikan. Penambahbaikan bagi karakteristik tekstur bagi snek penuh jagung-ikan telah dikaji dengan penukleusan bahan (kalsium karbonat, magnesium silikat, sodium bikarbonat dan bran) yang mana telah dicampurkan pada 1 hingga 2% untuk 3 agen penukleusan yang pertama dan pada 5 dan 10% bagi bran. Dapatan ini menunjukkan yang kesemua agen penukleusan secara signifikannya memperbaiki tekstur bagi snek yang penuh kecuali kepada bran. Di kalangan empat agen penukleusan yang dikaji, magnesium silikat pada 0.5% adalah pengubah tekstur yang terbaik. Struktur mikro bagi snek jagung-ikan yang penuh yang telah dikaji dengan Mikroskop Elektron Scanning menunjukkan yang diameter udara sel yang mengandungi 0.5% magnesium silikat telah dikurangkan sebanyak 7.32 kali ganda manakala bilangan sel per unit telah bertambah 4.76 kali ganda berbanding dengan pengawalan. Dalam usaha untuk mengoptimumkan keadaan penonjolan, rekabentuk eksperimen RSM telah dijalankan. Keadaan penonjolan yang optimum telah ditetapkan pada 116°C, 1107 g/min kadar suapan dan 148 rpm kelajuan skru. Kestabilan penyimpanan

bagi snek yang dibangunkan bagi kedua-dua tidak berperisan dan berperisan dibungkus dalam filem berbesikan Biaxillary Poly Propylene telah dikaji bagi tempoh penyimpanan selama 30 minggu. Keadaan bermikrob telah dinilai pada minggu 0, 15 dan 30 bagi penyimpanan manakala parameter berkimia dan bersensor telah dijalankan pada interval enam minggu bagi 30 minggu. Ianya dapat disimpulkan yang snek jagung-ikan penuh khasiat rangup tahan simpan mengandungi 15% ikan, 84.5% jagung dan 0.5% magnesium silikat (w/w) boleh dihasilkan dipekkkan dibawah keadaan atmosfera yang berbesikan BOPP dan diterima baik bagi tempoh penyimpanan bagi 28 minggu.

## ACKNOWLEDGEMENTS

First of all I would like to thank the Almighty ALLAH for his perpetual assistance. I also pray that God Subahanahu wa Ta'ala bless this work and make it useful for humanity.

I would like to express my gratitude to Professor Dr. Jamilah Bt Bakar, the chairman of my supervisory committee for her valuable advices, guidance, patience and encouragement. My appreciation is also extended to my co-supervisors Professor Dr. Russly B Abdul Rahman and Dr. Noranizan Mohd adzhan for their advices and supports. My best thanks also to Dr. Hamed Mirhosseini for his appreciated supports in the statistical analyses of the study.

I also acknowledge sincerely, my gratitude to the Iranian Fisheries Research Organization (IFRO) for their financial support and also the National Fish Processing Research Center (NFPRC- Iran) for providing the laboratory for chemical, microbial and sensory analyses.

I would like to acknowledge the snack manufacturing company “Golfam Talaei Alborz” for providing all materials and machinery required for conducting the study. My sincere thanks are also due to its investment in commercializing the finding of the study under the brand name of “Puffish”.

Finally, I would like to express my appreciations to all those who have contributed towards the success of this research in so many ways, big and small.

## CHAPTER 1

### INTRODUCTION

#### 1.1 Background of the study

Extrusion cooking has been shown to be the most efficient technology, in which we can break down raw food ingredients to a well cooked and pre-digested form. This process can increase storage stability from a few weeks to 9-12 months and the product can be consumed in a convenient, ready-to-eat form by the final consumer (Kazemzadeh, 2011). Classic extruded foods and snacks composed of cereals, starches, sugars and oils are believed to be low nutrient-dense food with wide range of consumers, particularly children and young people. They are known as "junk food" due to their high fat and carbohydrate and low protein content (Nurtama & Sulistyani, 1997). However, the global snack food market has developed remarkably in recent years and is expected to reach US\$334.7 billion by 2015. Nowadays the market demand for more nutritious snacks is rising considerably. Therefore, there is an increasing trend for some animal proteins to be mixed with grains to produce a complex matrix, using extrusion technology that would meet the needs of the new market demand (Jose, 2012).

Fish species are known to provide high content of important constituents for the human diet such as nutritional and readily-digestible proteins, lipid-soluble vitamins, microelements and polyunsaturated fatty acids (Friedman, 1996). However, it is not a major part of the diet for most Middle-Eastern people. Besides, in the seafood industry, 30-80% of the fish catch, depending on species, is not utilized for human consumption. Extrusion technology can provide a method to utilize fish muscle recovered from underutilized fish (Choudhury & Gogoi, 1996). Restructuring the fish proteins together with a carbohydrate matrix using extrusion technology, can result in a valuable ready-to-eat food that adds value to an underutilized fish species such as silver carp. Extrusion is the best method to eliminate anti nutritional factors. Furthermore this treatment is the most effective method to improve protein and starch digestibility (Alonso, Aguirre, & Marzo, 2000).

Its beneficiaries would be consumers, producers as well as suppliers. The combination of carbohydrates and fish proteins is excellent from the nutritional point of view (SR18, 2005). By combining complementary proteins, the overall quality of the protein as well as its digestibility will be increased. However, to bring this idea to fruition following problems need to be considered.

## 1.2 Problems statement

- I. Cereal extruded snacks are high-calorie and low-protein food.
- II. Silver carp (*Hypophthalmichthys molitrix*) is cultured in abundance but it is under-utilized. In spite of having white flesh muscle advantage and the potential of providing a good source of nutritious foodstuff, its abundance of tiny bones makes it unpopular for filleting and direct consumption particularly when the fish are small (less than 1kg).
- III. Since extrusion processes are normally designed for starch-based snacks, incorporation of fish muscle in extrusion feed could be problematic from different points of view e.g. technical, consumer acceptability and quality attributes.
- IV. The incorporation of minced fish as an ingredient of extruded puffed snack may affect the storage stability of the product.

Therefore, the present research was aimed at developing an extruded puffed corn-fish product with the following hypothesis and objectives.

### 1.3 Hypothesis

- I. Extrusion technology can be used to produce a nutritious extruded puffed corn-fish snack with an acceptable combination of corn and minced fish (silver carp).
- II. Nucleating agents such as inorganic salts are able to enhance the texture of the puffed corn-fish snack by compensating the negative effect of high moisture content of minced fish.
- III. Formulated snacks should have an acceptable storage stability due to its low  $a_w$  and low moisture.

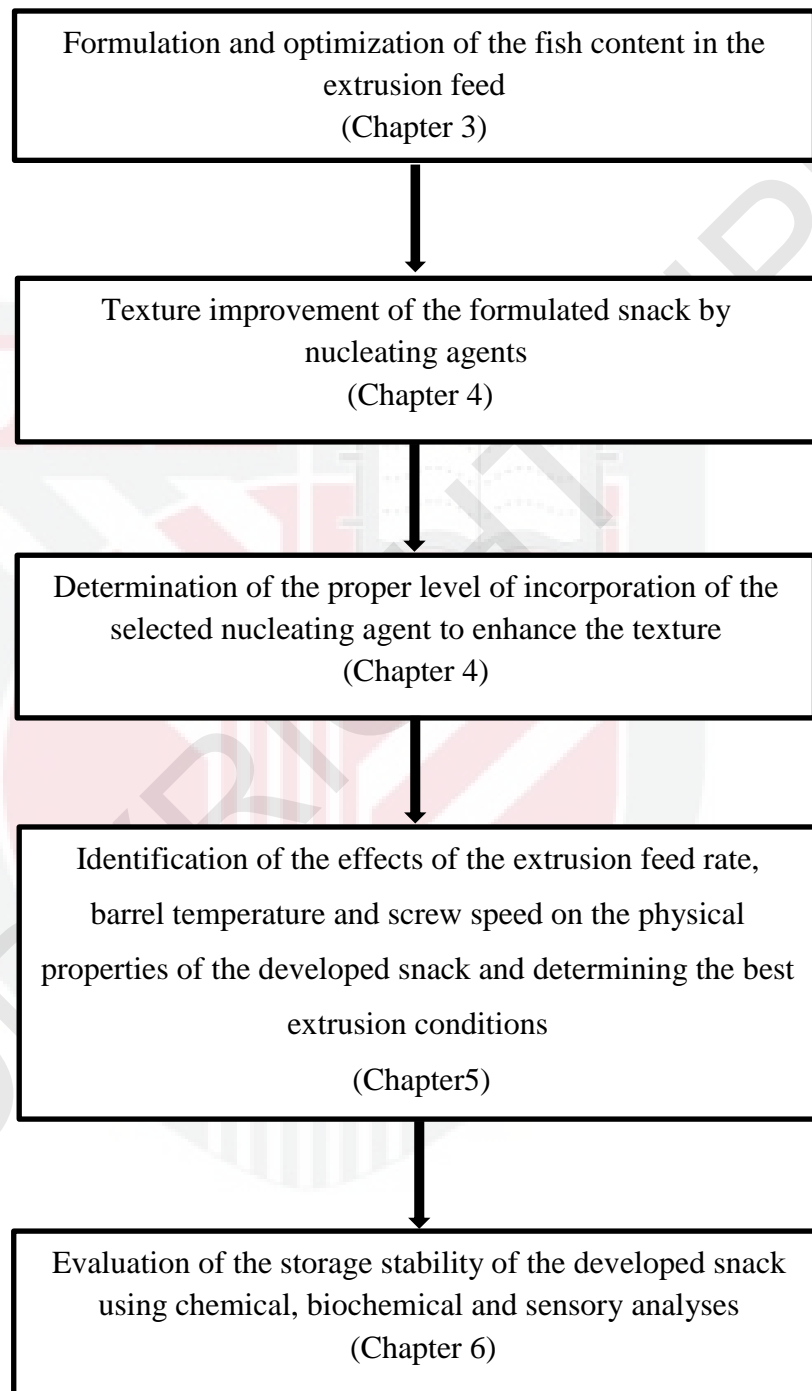

Therefore the objectives of the study are as below:

## 1.4 Objectives

- I. To develop an acceptable formulation for extrusion process and optimizing the fish content of the puffed corn-fish snack.
- II. To determine the effects of nucleating substances on the texture of the extruded corn-fish puffed snack, in order to enhance the texture, as well as determine a suitable additive and its proper level.
- III. To study the effects of process conditions on textural properties and to optimize feed rate, screw speed and barrel temperature of the developed puffed corn-fish snack.
- IV. To investigate quality changes during storage, determining storage stability and evaluating the effects of fish incorporation and packaging conditions on storage stability.
