Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfillment of the requirement for the degree of Doctor of Philosophy

EFFECTS OF P₂O₅ AND SINTERING TEMPERATURE ON MORPHOLOGICAL, PHYSICAL, AND MECHANICAL PROPERTIES OF SiO₂-Na₂O-CaO-P₂O₅ GLASS-CERAMIC

By

NUR FADILAH BINTI BAHARUDDIN PALLAN

January 2018

Chairman: Assoc. Prof. Khamirul Amin Matori, PhD

Institute: Institute of Advanced Technology

The great varieties of compositions and microstructures with specific technological properties have allowed glass-ceramics to be used in a wide range of applications. Materials fabricate from vitreous and ceramic wastes nowadays have been widely used in order to minimize the cost of production, eco-friendly materials, and reduce the landfill disposal matters. SiO₂-Na₂O-CaO-P₂O₅ (SNCP) composition was selected since lack of study has been discussed on SNCP glass-ceramic from waste material. This approach and opportunity have been taken to investigate further about the materials properties and compare with previous study. The main waste raw materials used are clam shells (CS) and soda-lime-silica (SLS) glass bottle. There are four types batch formulation of SNCP glass-ceramic that have been fabricated via conventional melt-quenching technique and solid state sintering. Each type of SNCP series were varied with different NaCO₃ to P₂O₅ weight percentage and samples were sintered at temperature 550–950 °C. Samples were sintered to discover effect sintering temperature evolving on morphological, physical, and mechanical properties of SNCP are highlighted in this study. The XRD results before sintering have been confirmed the existence of amorphous-crystalline phases on SNCP 1 and SNCP 4 samples while amorphous phase formation corresponding to SNCP 2 and SNCP 3 samples. The full crystallization for SNCP 1 and SNCP 4 started to occur at 650 °C while for SNCP 2 and SNCP 3 at sintering temperature 750 °C. Overall, the glass transition temperature (T_g) started at the range of 550–580 °C and the glass crystallization temperature (T_c) started from 600 °C to 743 °C. The existence of P₂O₅ in SNCP glass-ceramic is attributed to glass crystallization correlated with high intensity of crystallization peak and enhanced volume nucleation. The microstructural study observation showed SNCP 1 sample at 550–950 °C have agglomerated grain and porosity decreased which produce fine and uniform grain as the sintering temperature increases while the SNCP 2 until SNCP 4 showed less porosity, fine and uniform grain at 550–750 °C produced high densification microstructural. The density values (2.097–2.726 g/cm³) for SNCP 1–SNCP 4

obtained below the glass crystallization temperature at 550–750 °C contribute to excellent mechanical properties. SNCP 3 obtained the highest hardness (631 HV) at 650 °C than SNCP 1 (332 HV). The highest compressive strength in SNCP 1 (free-P₂O₅) is 49.66 MPa with Young's modulus value 0.678 GPa at sintering temperature 650 °C while SNCP 3 obtained the highest compressive strength (33.44 MPa) with Young's modulus value 0.882 GPa. Both samples have higher Young's modulus values when comparing from previous study (0.05–0.5 GPa) for the cancellous bone implantation. The influence of morphological and physical properties on SNCP 3 sample at sintering temperature 650 °C contribute to excellent mechanical strength properties.

KESAN P₂O₅ DAN SUHU PERSINTERAN KE ATAS SIFAT-SIFAT MORFOLOGIKAL, FIZIKAL, DAN MEKANIKAL SERAMIK-KACA SiO₂-Na₂O-CaO-P₂O₅

Oleh

NUR FADILAH BINTI BAHARUDDIN PALLAN

Pengerusi: Prof. Madya Khamirul Amin Matori, PhD
Institut: Institut Teknologi Maju

Kepelbagaian komposisi dan mikrostruktur yang bagus dengan ciri-ciri teknologi yang membolehkan seramik-kaca digunakan dengan meluas dalam pelbagai aplikasi. Pada masa kini, bahan yang dihasilkan berasaskan sisa kaca dan seramik telah digunakan secara meluas untuk mengurangkan kos pembuatan, bahan mesra alam, dan mengurangkan masalah pelupusan sampah. Komposisi SiO₂-Na₂O-CaO-P₂O₅ (SNCP) telah dipilih berdasarkan kekurangan perbincangan yang dilakukan sebelum ini terhadap seramik-kaca SNCP daripada bahan buangan. Peluang dan galakan telah diambil untuk mengkaji dengan mendalam tentang sifat bahan ini dan membandingkan dengan kajian yang lepas. Bahan buangan utama yang digunakan adalah kulit kerang (CS) dan botol kaca soda-kapur-silika (SLS). Ada empat jenis formulasi siri seramik-kaca SNCP yang dibuat menggunakan teknik sepuh lindap konvensional dan pensinteran keadaan pepejal. Setiap jenis siri berlainan dengan perbezaan peratus berat NaCO₃ kepada P₂O₅ pada suhu pensinteran 550–950 °C. Sampel telah disinter untuk mengkaji kesan perubahan SNCP pada sifat-sifat morfologikal, fizikal, dan mekanikal ditumpukan dalam kajian ini. Data analisis XRD sebelum pensinteran telah mengesahkan kewujudan fasa kristal-amorfus pada sampel SNCP 1 dan SNCP 4 sementara pembentukan fasa amorfus merujuk kepada sampel SNCP 2 dan SNCP 3. Penghabluran lengkap untuk SNCP 1 dan SNCP 4 mula berlaku pada suhu 650 °C sementara bagi SNCP 2 dan SNCP 3 pada suhu pensinteran 750 °C. Suhu perubahan kaca (T_g) berlaku pada julat suhu 550–580 °C dan suhu penghabluran kaca (T_c) bermula dari 600 °C hingga 743 °C. Pemerhatian kajian struktur mikro menunjukkan sampel SNCP 1 (tiada-P₂O₅) pada 550–950 °C mempunyai butiran bergumpal dan keliangan berkurangan menghasilkan butiran yang sekata dan teratur apabila suhu pensinteran bertambah manakala SNCP 2 hingga SNCP 4 menunjukkan kekurangan keliangan, halus, dan butiran yang sekata pada suhu 550–750 °C menghasilkan kepadatan struktur mikro yang tinggi. Nilai ketumpatan (2.097–2.726 g/cm³) bagi SNCP 1–SNCP 4 diperolehi di bawah suhu penghabluran kaca pada 550–750 °C yang menyumbang kepada sifat-sifat mekanikal

yang bagus. SNCP 3 memperoleh mikrokekuatan paling tinggi (631 HV) pada 650 °C berbanding SNCP 1 (322 HV). Kekuatan tekanan yang paling tinggi dalam SNCP 1 (tiada- P_2O_5) adalah 49.66 MPa dengan nilai modulus Young 0.678 GPa pada suhu pensinteran 650 °C sementara sampel SNCP 3 memperoleh kekuatan tekanan paling tinggi (33.44 MPa) dengan nilai modulus Young 0.882 GPa. Kedua-dua sampel telah memperbaiki dan mencapai nilai tinggi modulus Young apabila dibandingkan dengan kajian yang lepas (0.05–0.5 GPa) untuk implan jenis tulang kancellus. Pengaruh sifat-sifat morfologikal dan fizikal terhadap sampel SNCP 3 pada suhu 650 °C menyumbang kepada sifat-sifat kekuatan mekanikal yang bagus.

ACKNOWLEDGEMENTS

First praise and foremost is to Allah (S.W.T), on whom ultimately we depend for sustenance and guidance with his blessing, help, and will, we were able made this work a success. I would like to express my sincere appreciation and utmost gratitude to Assoc. Prof. Dr. Khamirul Amin Matori, Allahyarham Dr. Mansor Hashim, Dr. Norhazlin Zainuddin, and Dr. Raba'ah Syahidah Aziz for their constant monitoring, supporting, encouragement and sponsoring during the period of research. Working with them has provided me with a vast understanding on the materials science and theoretical experiences from which I will continue to draw benefit in the future. The most appreciation I would like to express is to my family, especially to my beloved father; Baharuddin Pallan Bin Abdullah, my beloved mother; Kathijah Binti Abdul Kader, and my beloved family; Mohd. Faizal, Muhammad Fairuz, Nor Faizah, Fariza, Allahyarhamah Imani, Aini, nieces and nephew for their endless support, encouragement and prayer. Thank you to my childhood best friend; Nor Ain Shahajar Ahmad Sohdi and Ikha Fadzila Md Idris for the support, help, and prayer.

I would like to thank to ITMA staff (Mr. Ali Rani, Mr. Kadri, Mrs. Sarinawani, Mrs. Roslina, Dr. Ismayadi, Miss Ija, and Mrs. Linda), XRD lab officer (Pn. Haslinda and Pn. Khamsiah), and mechanical lab; Mr. Wildan. To my colleagues in the GCCM Laboratory and MSCL Laboratory; Siti Nor Ain Rusly, Fadzidah Mohd Idris, Nurzilla Mohamed, Idza Riati Ibrahim, Zarifah Alassan, Nor Hapishah Abdullah, Noorfauzana Adnin, Rodziah Nadzlan, Wan Norailiana, Zamratul Maisarah, Farah Nabilah, Zaiti, Yusnita, Nuraine Mariana, Rosnah Nawang, Shamsul, Ghazal, Loy Chee Wah, Mohammad Zulhasif, Mohd Hafiz, Muhammad Syazwan, and Low Zhi Huang for their tremendous assistance and support throughout this research, idea, memorable interactions, support and encouragement. To my fellow friends during my postgraduate study; Dian Najihah, Nor Amalina Hafiza, Noraziah Ahmad, Maria Nuid, Aima Ramli, Arlina Ali, Noorhanim, Fiqa, Amy, Nazyha, Mahir, Maya, Nad, Yana, and many others for their great help and contributions. Thank you for everything.

I certify that a Thesis Examination Committee has met on 4 January 2018 to conduct the final examination of Nur Fadilah binti Baharuddin Pallan on her thesis entitled "Effects of P₂O₅ and Sintering Temperature on Morphological, Physical, and Mechanical Properties of SiO₂-Na₂O-CaO-P₂O₅ Glass-Ceramic" in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The Committee recommends that the student be awarded the Doctor of Philosophy.

Members of the Thesis Examination Committee were as follows:

Mohd Nizar bin Hamidon, PhD

Associate Professor
Faculty of Engineering
Universiti Putra Malaysia
(Chairman)

Irmawati binti Ramli, PhD

Associate Professor
Faculty of Science
Universiti Putra Malaysia
(Internal Examiner)

Abdul Halim bin Abdullah, PhD

Associate Professor
Faculty of Science
Universiti Putra Malaysia
(Internal Examiner)

Yasser Bakr Saddeek Muhammed, PhD

Professor
Al Azhar University
Egypt
(External Examiner)

NOR AINI AB. SHUKOR, PhD

Professor and Deputy Dean
School of Graduate Studies
Universiti Putra Malaysia

Date: 26 April 2018

This thesis was submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfillment of the requirement for the degree of Doctor of Philosophy. The members of the Supervisory Committee were as follows:

Khamirul Amin Bin Matori, PhD

Associate Professor
Faculty of Science
Universiti Putra Malaysia
(Chairman)

Raba'ah Syahidah Binti Aziz, PhD

Senior Lecturer
Faculty of Science
Universiti Putra Malaysia
(Member)

Norhazlin Binti Zainuddin, PhD

EDX	Energy Dispersive X-ray Spectroscopy
<i>P</i>	Density
HV	Vickers hardness
V	Volume
kgf	Kilogram force
<i>F</i>	Force
Å	Angstrom unit
MPa	Megapascal
GPa	Gigapascal
N	Newton

CHAPTER 1

INTRODUCTION

1.1 Background of the study

New glass-ceramic fabrication with special properties is an interesting study in the modern glass science and technology. Production of glass-ceramic has being a broad diversity and well-known materials in variety of applications. Glass-ceramics are a series of composite materials in which residual amorphous phase and crystalline phase coexist. Since the glass-ceramic is used in a large scale application, the materials technology is evolving rapidly. Glass-ceramic have been developed as essential clinical applications that associated to repair and reconstruction of skeletal system (bone, joints, and teeth) due to their biocompatibility with living tissue.

The bioactive materials incorporate of bioglasses, bioglass-ceramics, and calcium phosphate ceramics (Hench, 1991). The SNCP glass-ceramic is a suitable material to design and possible to produce high mechanical strength properties to be applied for bone implantation. The development of biomedical glass-ceramic generally is fabricated based on SNCP composition has been designed by Hench and the 45S5 bioglass were first found by Hench in 1969 which these types of glasses were able to bond to tissues (Hench, 2006). The bioglass fabricated by Hench were added with P_2O_5 compound as the ordinary starting powder substances. The Hench's glass composition is composed of SiO_2 (45%), Na_2O (24.5%), CaO (24.5%), and P_2O_5 (6%) in weight percentage (Hench et al., 1971). The same raw chemical materials according to Hench's glass composition were developed by Peitl et al. (1996) by thermal treatments. Peitl et al. (2001) developed SNCP glass-ceramics having chemical composition $1Na_2O-2CaO-3SiO_2$ and $1.5Na_2O-1.5CaO-3SiO_2$, containing 0–6 wt% of P_2O_5 . Mostly the applications of bioactive materials have been used in the medical field to repair and reconstruct diseased or damaged bones or tissues (Hench, 1991).

Nowadays, materials science researchers have found out the correlation between structure and properties of a novelty and improved materials with low cost production by using waste materials. The interesting part in this study, the SNCP glass-ceramic composition is fabricated from mixed powders of chemical and waste raw materials. The waste raw materials used are SLS glass bottle and clam shells. SNCP glass-ceramic composition from waste materials used in this study is the same as Hench's glass composition, but have been modified in different weight percentage. Abbasi and Hashemi (2014) was the first group using SLS waste glass to synthesize SNCP glass-ceramic via solid-state reaction method.

1.2 Mechanical properties of SNCP glass-ceramic

The sintering technique is used to obtain SNCP glass-ceramic final product which have better physical and mechanical properties for medical implantation. The mechanical interaction between implant and surrounding tissues need to be focus for the development of SNCP glass-ceramic from vitreous waste at different sintering temperature that affect to the changes in microstructural and physical properties. Low density glass-ceramic in the Na-Ca-Si-P-O system obtained low value of Young's modulus that closer to the cortical bone (Peitl, 1995). The Na₂O in SNCP glass-ceramic system have influenced the T_g value to obtain a linear relationship. There is a linear relation with Young's modulus values after the measurement of hardness, fracture toughness and fracture surface energy. The decrement in elastic moduli value as a function of temperature revealed the existence of structural softening in the glass network (Rajendran et al., 2002). When the T_g value decreased, the hardness value of a SNCP glass-ceramic is decreased (O'Donnell, 2011). The mechanical properties of SNCP glass-ceramic materials are greater than the amorphous glass and calcium phosphate ceramics (Rezwan et al., 2006). The value of Young's modulus for 45S5 bioglass is 30–35 GPa which is near to the cortical bone value (Kokubo, 1999). Sample sintered at 800–880 °C were compared with bulk sample before sintering (Sola et al., 2011). The effect after sintering on sample BG_Ca with high content of CaO showed vickers hardness is increased (Sola et al., 2011). The intention in this study is to evaluate influence of microstructural and physical properties to produce excellent mechanical strength properties at different sintering temperature with different batch formulation of SNCP glass-ceramic from vitreous waste. The mechanical properties will be compared with available literature and detect the suitable type of bone that possible for bone implantation.

1.3 Problem statement

The SNCP glass-ceramic materials have been developed widely with lots of changes occur due to the modification of composition by addition, doping or difference in ratio weight percentages for substances used in SNCP composition. Mostly, the SNCP compositions have been prepared using chemical raw materials but lack of previous research used SLS waste glass and CS waste to fabricate SNCP glass-ceramic system and reported about the mechanical strength properties specifically on microvickers hardness and compressive strength. The fabrication and characterization of SNCP glass-ceramic from SLS waste glass have been reported but the mechanical properties still absent (Abbasi and Hashemi, 2014). Hence, this effort have been taken to be the first research using the combination of SLS waste glass and clam shells waste to fabricate SNCP compositions subsequently to find optimal mechanical properties that can use for potential bone implantation application. This study is focused to evaluate morphology and physical properties that will influence the changes on mechanical properties of SNCP glass-ceramic from vitreous waste with low cost production and to save the environment from pollution matters (air and water pollution) which correlated with excess usage of chemical materials.

1.4 Objectives of the study

The primary goal of this research was to find out possibilities for improving the mechanical properties of SNCP glass-ceramic from vitreous waste and trace the potential type of bone for implantation.

The following objectives have been set in order to accomplish the primary goal of the research:

- i) To prepare SNCP glass-ceramic from mixed of chemical and waste materials at different batch formulation.
- ii) To determine the effect of different sintering temperatures on morphology-related properties, physical properties, and mechanical properties at different batch formulation of SNCP system.
- iii) To investigate the relationship and influence of morphology-related properties and physical properties on the mechanical properties of SNCP system.

1.5 Scope of study

The scope of study has been carried out as following:

- i) To prepare the SNCP 1–SNCP 4 glass-ceramic by using the chemical materials (Na_2CO_3 and P_2O_5) mixed with vitreous waste (SLS waste glass and CS waste) by using conventional melt-quenching and solid-state sintering technique at 550–950 °C.
- ii) The chemical elements analysis of SNCP samples were detected by utilizing EDX while the microstructural properties were observed through FESEM. The phase crystallization and crystal system of samples were confirmed via XRD analysis.
- iii) The chemical functional group and thermal properties (T_g and T_c) of SNCP have been analyzed by using FTIR and DSC respectively.
- iv) The physical properties were measured by means of Archimedes method to obtain density and volume of sample. The mechanical properties were measured via microvickers hardness tester while Universal Testing Machine (UTM) for measuring compressive strength and Young's modulus of SNCP.

1.6 Hypotheses of the study

The hypotheses of the study are correlated with the objective and the problem statement of the research. In this study, the sintering temperatures of SNCP samples are 550–950 °C with step temperature 50 °C for each sample. SNCP glass-ceramic sintering temperature increases would lead to high intensity, phase's transformation, new phases crystallization, and crystal system transformation. SNCP glass-ceramic sintering temperature increases would enhance grain size and increase porosity of SNCP glass-ceramic. The enhancement of grain size and porosity would lead to lower density value. At high sintering temperature, the elemental weight percentage of phosphorus would increase as the percentage of P₂O₅ increases. Excellent morphology and physical properties would develop superior mechanical properties of SNCP glass-ceramic. Hardness value would decrease as the glass transition temperature (T_g) decrease when sample is heated at high sintering temperature. Compressive strength of sample would increase as density and Young's modulus increases.

1.7 Organization of the dissertation

The dissertation is arranged as stated to clarify the structure of the dissertation and to present the different parts relate to each other. The current chapter (Chapter 1) provides a brief introduction background of the study, objectives and hypotheses of the research. The previous research area on glass-ceramic which focused on morphology, physical, thermal, structural bonding, and mechanical-related properties were discussed in Chapter 2. The details on research design and characterizations employed in this study can be found in Chapter 3. The results and discussion in Chapter 4 is divided into four different batch formulations of SNCP glass-ceramic which consist of SNCP 1, SNCP 2, SNCP 3, and SNCP 4 at different sintering temperature and evaluated on morphology, physical, thermal, structural bonding, and mechanical-related properties. Chapter 5 are conclusions effect of sintering temperature on morphology, physical, and mechanical-related properties separately at different SNCP compositions and subsequently recommendations for future work. The references, biodata of student, and list of publication were attached at the end of dissertation.
