One of the most reliable methods to improve the heterologous protein production is by conducting molecular cloning and expression of a targeted gene in an organism. This process requires extensive assessment on different promoters and hosts resulting in wastage of time, energy and resources. BLAST heuristic algorithm can predict lipase expression in *Pichia pastoris*. This study aims to develop a promoter prediction system for recombinant lipase expression in commonly used yeast expression system, *P. pastoris* using BLAST heuristic algorithm. Published experimental results of lipase expressed in *P. pastoris* were curated manually from publicly available databases and used for lipase database development. Two databases were developed, to store, organize and manage the curated data using MySQL and protein sequences in FASTA format using flat file. As for prediction, a BLAST heuristic method was implemented for sequence alignment and similarity comparison using Perl scripting language. The prediction system consists of two modules; Lipase Expression Database (LipExDB) and Lipase Expression Prediction System (LipExPS). LipExDB is a module for storing curated data and providing users with interface to query and retrieve information; and LipExPS is a module for users to upload the query sequence and retrieve the results of sequence alignment and other statistical parameters such as percentage of similarity and e-value. A user interface was provided for LipExPS. ARM lipase was used to validate the LipExPS. The predicted result of ARM lipase was used to clone into pGAPZ $\alpha$ A and pPICZ $\alpha$ B vectors followed by transformation into *P. pastoris*. The expression of ARM lipase was monitored in *P. pastoris* strain GS115. Based on the experimental validation, ARM lipase was successfully expressed in *P. pastoris* strain GS115 using GAP and AOX promoters as predicted by LipExPS. LipExPS was able to address the problem of promoter/host choice in lipase expression when using *P. pastoris* as a host by predicting the promoters that can be used to express the gene submitted to LipExPS. LipExDB would provide researchers with more information on lipase expression in *P. pastoris*. The development of this prediction system would facilitate the expression of lipase gene in *P. pastoris* thus saving resources, time and energy.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia dalam memenuhi keperluan untuk Ijazah Sarjana Sains

**PEMBANGUNAN DAN PENGESAHAN SISTEM RAMALAN PROMOTER  
UNTUK PENGEKSPRESAN LIPASE REKOMBINAN DI *Pichia pastoris***

Oleh

**MAYAKI FATIMA GOGO**

April 2017

**Pengerusi : Siti Nurbaya Oslan, PhD**  
**Fakulti : Bioteknologi dan Sains Biomolekul**

Salah satu kaedah yang boleh digunakan untuk meningkatkan pengeluaran protein heterologus adalah dengan menjalankan pengklonan dan ekspresi molekular gen yang dikehendaki di dalam organisma. Proses ini memerlukan pemilihan menyeluruh promoter dan hos yang berbeza, di mana akan mengakibatkan pembaziran masa, tenaga dan sumber. Algoritma heuristik BLAST boleh meramalkan ekspresi lipase dalam *Pichia pastoris*. Kajian ini bertujuan untuk membangunkan sistem ramalan promoter untuk mengekspreskan lipase rekombinan dalam sistem ekspresi yis *P. pastoris* menggunakan algoritma heuristik BLAST. Hasil eksperimen yang telah diterbitkan dalam pangkalan data umum, dikumpulkan secara manual dan digunakan untuk pembangunan pangkalan data lipase. Dua pangkalan data telah dibangunkan untuk menyimpan, menyusun dan menguruskan data yang dikumpul menggunakan MySQL dan jujukan protein dalam format FASTA menggunakan fail rata. Bagi pembangunan sistem ramalan, kaedah heuristik BLAST yang telah dilaksanakan untuk penjajaran jujukan protein dan perbandingan persamaan menggunakan bahasa pengaturcaraan Perl. Sistem ramalan ini terdiri daripada dua modul; pangkalan data ekspresi lipase (LipExDB) dan sistem ramalan ekspresi lipase (LipExPS). LipExDB adalah modul untuk menyimpan data yang terkumpul disamping menyediakan antara muka pengguna untuk pertanyaan dan mendapatkan maklumat; manakala LipExPS adalah modul untuk pengguna memuatnaik jujukan pertanyaan dan mendapatkan keputusan penjajaran jujukan berserta parameter statistik yang lain seperti peratus persamaan dan e-nilai. Antara muka pengguna telah disediakan bagi kegunaan LipExPS. ARM lipase telah dipilih untuk mengesahkan sistem LipExPS. Hasil ramalan telah digunakan untuk proses mengklonkan ARM lipase ke dalam pGAPZ $\alpha$ A dan pPICZ $\alpha$ B vektor, diikuti dengan transformasi ke dalam *P. pastoris*. Ekspresi ARM lipase dipantau dalam *P. pastoris* GS115. Berdasarkan pengesahan eksperimen itu, ARM lipase berjaya diekspreskan di dalam *P. pastoris* GS115 menggunakan promoter GAP dan AOX seperti yang diramalkan oleh LipExPS. LipExPS berjaya menangani masalah pilihan promoter/hos dalam ekspresi lipase di dalam *P. pastoris*. Sistem ramalan promoter (LipExPS) ini boleh digunakan dalam pengekspresan gen di dalam

*P. pastoris*. LipExDB juga akan memberikan maklumat lebih lanjut mengenai ekspresi lipase dalam *P. pastoris*. Pembangunan sistem ramalan ini akan memudahkan pengekspresan lipase dalam *P. pastoris* sekaligus menjimatkan sumber, masa dan tenaga.

## ACKNOWLEDGEMENTS

Alhamdulillah, all glory and thanks be to Almighty Allah for his mercy and blessings all through this thesis. A lot of people have contributed to the completion of this thesis.

First, I would like to thank my supervisor Dr. Siti Nurbaya Oslan for her encouragement, advice, guidance and support all through my research work. I appreciate the effort of my co-supervisors: Prof. Dato' Dr. Abu Bakar Salleh and Dr. Arpah Abu for their support, time, and patience towards the completion of this study. Also my appreciation goes to Enzyme and Technology (EMTech) Research group for their support all through my study. Thanks to my lab mates IBS and DG4 (UM).

To my late mother (late Haj Fatima N Mayaki) who saw the start of this study but not the end. Thanks for your support, love, and prayers to see me succeed and may Allah grant her Al-janatural Firdausi (Amin).

To my father Alh S. N Mayaki, my siblings (Jummai, Isah, Mohammed, Amina and Abubakar), relatives and friends thanks for your support, love and care.

Finally, I will like to appricate Tertiary Education Trust Fund (TETFund) and Ibrahim Badamasi Babangida University Lapai for their financial assistance.

I certify that a Thesis Examination Committee has met on 4 April 2017 to conduct the final examination of Mayaki Fatima Gogo on her thesis entitled "Development and Validation of Promoter Prediction System for Recombinant Lipase Expression in *Pichia pastoris*" in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The Committee recommends that the student be awarded the Master of Science.

Members of the Thesis Examination Committee were as follows:

**Umi Kalsom binti Md Shah, PhD**

Associate Professor  
Faculty of Biotechnology and Biomolecular Sciences  
Universiti Putra Malaysia  
(Chairman)

**Noor Azmi Shaharuddin, PhD**

Senior Lecturer  
Faculty of Biotechnology and Biomolecular Sciences

# CHAPTER 1

## INTRODUCTION

In computational biology, predictions are used in various aspects such as in predicting protein-protein interactions, protein structure and transcription bind site, gene expression and drug discovery and design (Hartner *et al.*, 2008; Barbosa *et al.*, 2015). In order for a prediction system to exist an algorithm is needed. Algorithms are set of statistical formulas used to solve a problem (Parikh & Boyd, 2013). There are different categories of algorithms such as simple recursive algorithms, backtracking algorithms, divide-and-conquer algorithms, dynamic programming algorithms, greedy algorithms and branch-and-bound algorithms (Seddon *et al.*, 2013; Fernandez *et al.*, 2017).

Widely used in computational biology and bioinformatics is dynamic programming algorithms (Badr *et al.*, 2014). These algorithms are used for optimization problems because it can remember past results and use it to find new results (Xia, 2013; Jou *et al.*, 2016; Reeb *et al.*, 2016). These algorithms are used for protein folding, RNA structure prediction and sequence alignment (Bandyopadhyay *et al.*, 2006). Examples of sequence alignment dynamic programming algorithms are Basic Local Alignment Search Tool (BLAST) (Altschul *et al.*, 1990) and FAST All (FASTA) (Lipman & Pearson, 1985). Both BLAST and FASTA are used for nucleotides and proteins sequence analysis (Neumann *et al.*, 2014). Algorithms are implemented on databases to make predictions (Wang & Bryant, 2014).

Databases are organized collection of information which are arranged for easy access, management and updating (Medvedeva *et al.*, 2015). They are classified based on the information content. The functions of a database include storing data, managing data and indexing data (Alonso & Korth, 1993; Kroger, 2001). The functions of a database management system (DBMS) are data definition, updating and retrieving information (Altman, 2004; Murovec *et al.*, 2015). Most databases curate data such as protein data (Finn *et al.*, 2016), weather data (Field *et al.*, 2015) and pollution data (Falchi *et al.*, 2016). Examples of protein data include enzymes and hormones.

Enzymes play an important role in many industries which makes their production also crucial. Enzymes are important in detergent, fermentation, textiles, paper and dairy industries (Ray, 2012). There are many enzymes available that suit industrial use such as lipases, amylases and proteases. The hydrolysis of fats and oil is carried out by the enzyme lipase (triacylglycerol ester hydrolases, EC 3.1.1.3) with subsequent release of monoacylglycerols, diacylglycerols, free fatty acids, and glycerol (Villeneuve *et al.*, 2000). These enzymes are ubiquitous in nature. The hydrolysis of triglycerides takes place at the interface between the insoluble substrate and water (Quyen *et al.*, 2003). These enzymes have also been used broadly in hydrolysis of a variety of esters and enantio- selective synthesis (Nars *et al.*, 2014). Antioxidants, biodiesel production, cosmetic, syntheses of antitumor, biosensor construction, waste water treatment are applications of this enzyme. Lipases are largely produced from microbes

and specifically bacterial play an important role in the production of lipases (Hasan *et al.*, 2009; Guillén *et al.*, 2011).

For industrial enzyme production, genes are cloned and expressed in various hosts such as yeast, bacteria and mammalian cells in order to increase their productivity (Cereghino & Cregg, 2000). In this study, the focus is on the development of a promoter prediction system for lipase expression in *Pichia pastoris*. *Pichia (Komagataella) pastoris*, a methylotrophic yeast that use methanol as sole carbon and energy source. Due to the ability of this yeast to utilize methanol, carry out post-translational modifications, higher yield and easy to manipulate it was evaluated as a potential source of single-cell protein (Cos *et al.*, 2006; Lin-Cereghino *et al.*, 2013).

At the moment, only few methods are available for the enhancement of higher expression of proteins in *P. pastoris* (Nocon *et al.*, 2014). Most of the methods involve the optimization of the expression vectors and none is available to choose a promoter/host prior to cloning (Puxbaum *et al.*, 2015; Zhou *et al.*, 2015). Prior to cloning, the choice of promoter/host is done by trial and error method. BLAST heuristic algorithm can predict promoter/host prior to cloning of lipase in *P. pastoris*. Hence, this study focussed on the development of a promoter prediction system for recombinant lipase expression in *P. pastoris*.

The main research objective is:

To develop and validate a promoter prediction system for recombinant lipase expression in *P. pastoris* using BLAST heuristic algorithm.

In order to achieve this objective, the following sub-objectives were conducted:

1. To develop a lipase expression database from *P. pastoris*.
2. To implement BLAST heuristic algorithm in Perl.
3. To validate the prediction system experimentally.
