DEDICATION

I would like to dedicate to my beloved husband who helped me all the time during my study. Similarly, many thanks go to my father, brothers and sisters who supported me with prayers and endured the pain of being away for four years. In last, I also would like to dedicate my friends, who helped me with all what they got and these are the people whom I will never forget.

Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfillment of the requirement for the Degree of Doctor of Philosophy

TAXONOMIC REVISION OF STINOCCHIINAE, TENEBRIONINAE AND DIAPERINAE (COLEOPTERA:TENEBRIONIDAE) FROM MALAYSIA

By

DARYA KAREEM HWAYYIZ

March 2017

Chairman : Associate Professor Nur Azura Adam, PhD
Faculty : Agriculture

This study established the current taxonomic status of 30 species of darkling beetles (Coleoptera: Tenebrionidae) in Malaysia. A total of 392 specimens were examined. Thirty species has been identified belonging to three subfamilies, nine tribes and 17 genera with four potential new species and one potential new genus. A total number of 16 species were recorded for the first time in Malaysia namely *Amarygmus metallicus*, *A. ovoides*, *Derosphaerus aeruginosus*, *Gonocephalum hispidocostatum*, *Leprocaulus rotundicollis*, *Promethis semisulcata*, *P. coracina*, *P. punctulator*, *P. opaca*, *Pseudonautes vagevittatus*, *Pseudoblaps javana*, *Strongylium erythrocephalum*, *S. orientale*, *S. various*, *Uloma sextuberosa* and *U. excise*. A total of 42 internal and external morphological characteristic have been described for each species. Eleven structures for each species were illustrated based on their specific state namely antenna, labrum, labium, mandible, maxilla, pronotum, fore-leg, mid-leg, hind-leg, elytra, aedeagus. Taxonomic key to genera of subfamily Stinochiinae, genera of subfamily Tenebrioninae and the species of the genera *Promethis*, *Strongylium*, *Eucyrtus*, *Gauromaia*, *Amargymus*, *Uloma*, *Tribolium* species has been successfully developed. The distribution of Tenebrionidae species in Malaysia were shown in the maps for each species. The most common species is *Tribolium castanum*, *Tribolium confusum*, some species of the genus *Promethis*, the less common species is *Uloma excisa*, and rare species is *Strongylium varians*. A comprehensive checklist of Malaysian Tenebrionidae was developed for the first time with the total number of 207 species belonging to 64 genera. The highest number of the species has been found in Borneo followed by Penang and Malacca. The less number of the species have been found in Perak. The taxonomical effort produced from this study will be helpful for enhancing the species discovery while maintaining species inventories of Malaysian Tenebrionidae.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk Ijazah Doktor Falsafah

SEMAKAN TAKSONOMI STINOCHIINAE, TENEBRIONINAE DAN DIAPERINAE (COLEOPTERA:TENEBRIONIDAE) DARI MALAYSIA

Oleh

DARYA KAREEM HWAYYIZ

Mac 2017

Pengerusi : Profesor Madya Nur Azura Adam, PhD
Fakulti : Pertanian

Kajian ini telah memperihalkan status semasa taksonomi 30 spesies kumbang Tenebrionidae (Coleoptera) di Malaysia. Sejumlah 392 spesimen telah diperiksa. Sebanyak 30 spesies telah diperihal tergolong dalam tiga subfamili, sembilan tribus dan 17 genus dengan potensi tiga spesies baru dan satu genus baru. Sejumlah 16 spesies telah direkodkan buat kali pertama di Malaysia iaitu *Amarygmus metallicus*, *A. ovoides*, *Derosphaerus aeruginosus*, *Gonocephalum hispidocostatum*, *Leprocaulus rotundicollis*, *Promethis semisulcata*, *P. coracina*, *P. punctulator*, *P. opaca*, *Pseudonautes vagevittatus*, *Pseudoblaps javana*, *Strongylium erythrocephalum*, *S. orientale*, *S. various*, *Uloma sextuberosa* and *U. excise*. Sebanyak 42 ciri morfologi dalaman dan luaran telah diperihalkan bagi setiap spesies. Sebanyak 11 struktur bagi setiap spesies telah diilustrasi berdasar kepada ciri spesifiknya iaitu antena, labrum, labium, mandibel, maksila, pronotum, kaki hadapan, kaki tengah, kaki belakang, elitra dan aedegus. Taburan spesies Tenebrionidae di Malaysia ditunjukkan dalam peta. Spesies paling umum ialah *Tribolium castanum*, *Tribolium confusum* dan sebahagian spesies di bawah genus *Promethis* manakala spesies kurang umum ialah *Uloma excisa*, manakala spesies langka ialah *Strongylium varians*. Satu senarai semak yang komprehensif telah dibangunkan buat pertama kalinya untuk spesies Tenebrionidae di Malaysia di mana jumlah spesies Tenebrionidae Malaysia adalah sebanyak 207 spesies terdiri daripada 64 genera. Jumlah spesies terbanyak dijumpai di Borneo diikuti oleh Pula Pinang dan Melaka. Perak mempunyai bilangan spesies terendah. Usaha kajian taksonomi daripada kajian ini membantu dalam meningkatkan penemuan spesies di samping menyelenggara inventori spesies Tenebrionidae di Malaysia.

ACKNOWLEDGEMENTS

All praise and gratitude for the beloved Allah; who is the compassionate and the most Merciful. This work would have been impossible without the continuous support and supervision of my supervisor, Associate Professor Dr.Nur Azura Adam. All steps taken on the way to finishing this thesis were under her direct guidance and also the other members of the supervisory committee, Dr. Lau Wei Hong and Dr. Izfa Riza and also thankful for the laboratory assistant, Mr. Hishamuddin Zainuddin, who endured with great patience in all my laboratory tasks.

I would like to express my sincere gratitude to Dr. Julio Ferrer who supported me spiritually and scientifically. I thank the individuals who helped my field sampling Dr. Azman Sulaiman and Mr. Audi and thanks to all workers in Kinabalu park who they gave me the chance to check my specimen and loaning me some of their specimen.

I certify that a Thesis Examination Committee has met on 31 March 2017 to conduct the final examination of Darya Kareem Hwayyiz on her thesis entitled "Taxonomic Revision of Stinochiinae, Tenebrioninae and Diaperinae (Coleoptera: Tenebrionidae) from Malaysia" in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The Committee recommends that the student be awarded the Doctor of Philosophy.

Members of the Thesis Examination Committee were as follows:

Hafidzi bin Mohd Noor, PhD

Associate Professor
Faculty of Agriculture
Universiti Putra Malaysia
(Chairman)

Dzolkhifli bin Omar, PhD

Professor
Faculty of Agriculture
Universiti Putra Malaysia
(Internal Examiner)

Bakhtiar Effendi Yahya, PhD

Senior Lecturer

Date: 6 July 2017

This thesis was submitted to the Senate of the Universiti Putra Malaysia and has been accepted as fulfillment of the requirement for the degree of Doctor of Philosophy. The members of the Supervisory Committee were as follows:

Nur Azura Adam, PhD

Associate Professor
Faculty of Agriculture
Universiti Putra Malaysia
(Chairman)

Lau Wei Hong, PhD

Senior Lecturer
Faculty of Agriculture
Universiti Putra Malaysia
(Member)

Izfa Riza Hazmi, PhD

Senior Lecturer
School of Environmental and Natural Resources Sciences
Faculty of Science and Technology
Universiti Kebangsaan Malaysia
(Member)

ROBIAH BINTI YUNUS, PhD

Professor and Dean
School of Graduate Studies
Universiti Putra Malaysia

Date:

Declaration by graduate student

I hereby confirm that:

- this thesis is my original work;
- quotations, illustrations and citations have been duly referenced;
- this thesis has not been submitted previously or concurrently for any other degree at any institutions;
- intellectual property from the thesis and copyright of thesis are fully-owned by Universiti Putra Malaysia, as according to the Universiti Putra Malaysia (Research) Rules 2012;
- written permission must be obtained from supervisor and the office of Deputy Vice-Chancellor (Research and innovation) before thesis is published (in the form of written, printed or in electronic form) including books, journals, modules, proceedings, popular writings, seminar papers, manuscripts, posters, reports, lecture notes, learning modules or any other materials as stated in the Universiti Putra Malaysia (Research) Rules 2012;
- there is no plagiarism or data falsification/fabrication in the thesis, and scholarly integrity is upheld as according to the Universiti Putra Malaysia (Graduate Studies) Rules 2003 (Revision 2012-2013) and the Universiti Putra Malaysia (Research) Rules 2012. The thesis has undergone plagiarism detection software

CHAPTER ONE

INTRODUCTION

1.1 Background of the study

Tenebrionidae is the fifth largest and one of the most diverse families within order Coleoptera that contains more than 18,000 insect species (15,000 described) world wide (Matthews & Bouchard, 2008) and exhibits an extraordinary wide range of superficial dissimilarity. It makes up the large group of nocturnal beetles and usually referred as “Darkling Beetles” that is a common name for this large family.

Family Tenebrionidae is of a great economic importance as it contains insect pests that are cosmopolitan in nature and most imperatively are associated with stored products (Martin *et al.*, 2012). Generally, these insect pests feed on plant materials including decaying matter, wood, leaf litters, pollen, fungal and algal matters. Some are also scavengers whereas few of them are predatory especially the wood boring beetles. In Tenebrionidae, insect species are mostly large in size and flightless beetles however other insect species within similar family living in rotten wood and stored products are also small in size (Soldati & Soldati, 2003).

The greater numbers of these species occur in warmer climates particularly in the more arid regions such as in the Namib and Gobi deserts. The varied adaptations of the species enable them to survive in extreme high temperature and the periods of prolonged drought. These facts have caused the Tenebrionidae to be regarded as the most highly evolved family of the Cucujoidea (Crowson, 1955). These darkling beetles that inhabit in the most torrid deserts can survive in a temperature of 50°C, they normally burrow under the stones, bark and leaf litters and they have long legs that keep their bodies at a safe distance from the burning sand and enable them to move speedily, many of these are excellent burrowers and can bury themselves in the sand immediately to escape from the heat (Schawaller, 1996; Bouchard *et al.*, 2005).

The great importance of family-group names for the classification and nomenclatural stability of Coleoptera was clearly demonstrated by Lawrence and Newton (1995). But, due to close resemblances to the members of other families, some of the adults in family Tenebrionidae have been often wrongly identified in a preliminary sorting stage especially in most Carabidae (Chrysomelidae) identification (Watt, 1974). Previously, the most systematic work has been carried out at the specific and generic levels and few have attempted to improve the higher classification within the family.

The morphological diversity of the members of this family is very difficult to diagnose the entire fauna (Aalbu *et al.*, 2002), however a synthetic treatment of the taxonomy, biology and distribution of Tenebrionidae has been previously presented. But it still largely comprises a synthesis of the classifications given by Leconte & Horn (1883)

and Lacordaire (1859) which were mostly based on adults because of the great similarities between the species of this family so it was important to show the different characters of the species, larvae in this family tend to be more uniform and easily recognisable superficially.

Therefore, this study has been attempted to provide a stable classification scheme for the family Tenebrionidae especially for three Subfamilies such as Stinochiinae, Tenebrioninae and Diaperinae with a synoptic classification of the world fauna that summarizes recent knowledge about the relationships among suprageneric groups as well as a catalogue of family-group names especially in Malaysian agro-ecosystem.

1.2 Significance of the study

Due to the economic damages caused by some of the species of the subfamilies Stinochiinae, Tenebrioninae and Diaperinae, it is essential to conduct a study for their proper identification. There is still a gap in their taxonomical study of the insect species from these subfamilies especially in Malaysia therefore it is an important to identify these species in order to control their damages.

1.3 Research Objective(s)

The objectives of this study are:

- 1- to identify the selected species of family Tenebrionidae and study their distribution in Malaysia.
- 2- to construct the keys of selected species of family Tenebrionidae in Malaysia.
- 3- to describe and illustrate the selected morphology characters of each species and to describe the genitalia.
- 4- to develop a checklist of Malaysian Tenebrionidae.

1.4 Outline of thesis

This thesis is divided into five chapters. After an introductory Chapter 1, Chapter 2 presented some background of the research with a literature addressing two important topics of taxonomy and key identification. In Chapter 3, material and methods are presented while Chapter 4 postulated the construction of the keys of each species, identification, description, illustration and a checklist are also provided. Finally, in Chapter 5, summary of this study and recommendations for future research have been presented.
