Chairman : Syahrilnizam Abdullah, D.Phil Faculty : Medicine and Health Sciences

The use of efficient vector is essential in gene therapy, which has the promising potential to treat not only genetic diseases but also acquired diseases. Although plasmid DNAs (pDNA) have been shown to be a much safer alternative compared to viral vectors, limitations, like detrimental inflammatory response and transient transgene expression, hinder its clinical application. This is mainly due to the presence of unmethylated cytosine guanine (CpG) motifs on pDNA. As a solution, CpG-free pDNA (p0CpG) was developed, where CpG motifs are completely depleted from the pDNA backbone and transgene. In addition, the safety and efficacy of the p0CpG were further reinforced with significant therapeutic effect observed in a cystic fibrosis clinical trial. Given these points, extending the application of clinically relevant p0CpG towards ex vivo gene therapy would be a novel approach to treat many disorders. However, it was recently reported that the depletion of CpG motifs from transgene could affect the *in vitro* gene expression negatively. Similar results may also extend to p0CpG, as the p0CpG is also devoid of CpG motifs. Thus, the main objective of this study is to evaluate the performance of p0CpG in vitro, specifically the effect of CpG depletion from the transgene.

First, expression of luciferase reporter gene was compared between p0CpG and a CpG-containing pDNA in multiple human cell lines. Surprisingly, pCpG-free exhibited poor expression *in vitro* that contradicts published *in vivo* reports. To determine if this was due to the CpG depletion from transgene, two novel pDNAs were constructed where each has CpG-free

backbone with Green Fluorescent Protein (GFP) gene that is either CpG-free (pZGFP) or contains 60 CpGs (pRGFP). pZGFP showed significantly inferior transgene expression when compared to pRGFP, despite using different gene transfer agents (lipid or polymer-based) or cell types (human, mouse cell lines & primary mouse cells). Besides that, there was no significant difference in pDNA copy number and toxicity between the pDNAs. Therefore, the low expression of pZGFP is attributed to CpG depletion from transgene. Upon further investigation, the lower expression of pZGFP was not due to mRNA export but was due to lower transcriptional rate as observed in mRNA distribution studies. In conclusion, complete depletion of CpG motifs from transgene in p0CpG resulted in reduced transcription rate. Data obtained from this study could be used to improve and optimize p0CpG for *ex vivo* gene therapy approach in the future.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk Ijazah Master Sains

## PLASMID DNA BEBAS-CpG MENGHASILKAN EKSPRESI GEN PELAPOR In Vitro YANG TERBATAS KERANA KECANGGUNGAN TRANSKRIPSI

Oleh

#### MUHAMMAD OMAR BIN HABIB RAHUMAN

Mac 2017

Pengerusi : Syahrilnizam Abdullah, D.Phil Fakulti : Perubatan dan Sains Kesihatan

Penggunaan vektor yang efisien adalah penting dalam terapi gen, yang berpotensi untuk merawat bukan sahaja penyakit genetik, malah penyakit rumit juga. Walaupun plasmid DNA (pDNA) merupakan alternatif yang lebih selamat berbanding vektor virus, aplikasi klinikal pDNA adalah terhad disebabkan oleh tindak balas keradangan yang membahayakan dan penghasilan ekspresi gen terapeutik yang terbatas. Kesan-kesan sampingan ini berpunca daripada motif cytosine-guanine (CpG) yang tidak dimetil. Sebagai penyelesaian, pDNA bebas-CpG (p0CpG) dihasilkan, di mana motif CpG dilupuskan dari tulang belakang pDNA dan transgen. Disamping itu, keselamatan dan keberkesanan p0CpG diperkukuhkan lagi apabila pengunaan p0CpG didapati berkesan untuk merawat pesakit cystic fibrosis di peringkat ujian klinikal. Oleh itu, pelanjutan penggunaan p0CpG ke arah terapi gen ex vivo akan menjadi satu pendekatan rawatan baru yang mampu dimanfaatkan ke atas pelbagai penyakit. Walaubagaimanapun, terbitan terkini melaporkan bahawa pelupusan motif CpG daripada transgen akan memberi kesan negatif pada ekspresi transgen in vitro. Kemungkinan, hasil terbitan ini boleh diperhatikan pada p0CpG kerana CpG motif juga dilupuskan dari p0CpG. Oleh itu, objektif utama kajian ini adalah untuk menilai prestasi p0CpG in vitro, khususnya pada kesan pelupusan CpG dari transgen.

Pertama, ekspresi gen pelapor luciferase telah dibandingkan di antara p0CpG (pCpG-free) dan pDNA yang mengandungi CpG (pCpG-rich) pada beberapa jenis sel manusia *in vitro*. Sebaliknya, pCpG-free menghasilkan

ekspresi transgen yang terhad di *in vitro* yang bercanggah dengan penemuan kajian in vivo yang diterbitkan. Untuk menentukan sama ada penemuan ini disebabkan oleh pelupusan CpG dari transgen, dua pDNA telah dicipta di mana masing-masing mempunyai tulang belakang bebas-CpG yang sama, tetapi mempunyai Green Fluorescent Protein (GFP) transgen yang berbeza, sama ada bebas-CPG (pZGFP) atau mengandungi 60 CpG (pRGFP). pZGFP menunjukkan kadar ekspresi jauh lebih rendah berbanding pRGFP walaupun menggunakan ejen penyampaian gen (lipid atau polimer) atau sel (sel manusia, sel mencit & sel primer mencit) yang berbeza. Selain itu, tiada perbezaan yang signifikan dari segi bilangan unit pDNA dalam sel dan ketoksikan antara pDNA. Oleh itu, ekspresi yang rendah dari pZGFP adalah disebabkan oleh pelupusan CpG daripada transgen. Dengan siasatan lanjut, ekspresi rendah pZGFP bukan disebabkan oleh pembatasan eksport mRNA tetapi disebabkan oleh kadar transkripsi yang lebih rendah. Kesimpulannya, pelupusan motif CpG daripada transgen di p0CpG menyebabkan kadar transkripsi berkurangan. Data yang diperolehi daripada kajian ini boleh digunakan untuk memperbaiki dan mengoptimumkan prestasi p0CpG untuk aplikasi terapi gen *ex vivo* pada masa hadapan.

#### ACKNOWLEDGEMENTS

#### "Guide us to the right path" (Quran 1: 6)

My MSc journey was filled with hardships, despairs, lessons, and celebrations that guided me to my destination, the completion of this thesis. This was only possible due to the support and guidance provided by kind individuals and without them, I am nothing. I am honoured to acknowledge the following individuals for their enormous contribution.

I owe my very existence to the contributors of my genome, my parents. The discipline, tenacity, and courage that I have demonstrated were inspired and instilled by my late father. I often wish that I had another chance to have intellectual discussions and to celebrate my achievements together. But I'm sure that I have his continuous blessings and we will meet up soon. Moreover, I have to stress that none of this is remotely possible without the unconditional love provided by my mother, the pillar of my life. I cannot begin to fathom the sacrifices she made as a single mother, dealing with the harshness of the world that kept her awake most nights, to ensure that her son is able to achieve and live his dream. She is the source of my drive and energy everyday (even literally because I inherited mitochondrial DNA from her). Even if I am able to serve her for eons, I can never repay her for all that she has done for me.

My decision to study MSc was greatly influenced by my undergraduate internship in Medical Genetics Unit (MGU). Although my initial motive for interning at MGU was due to curiosity, curiosity quickly became a burning interest, specifically through my interactions with the PIs. I vividly remember the exhilarating discussions that I had with graduate students and PIs during "Special Topic in Human Genetics" module. Furthermore, my interaction with my internship supervisor further increased my interest in research. I am grateful for the internship and support given by MGU especially to all the PIs who have contributed directly or indirectly. While at it, I would like to thank my co-supervisors and co-mentors, Dr. Michael Ling, Dr. De-Ming Chau, and Dr. Abhimanyu. Their passion and charisma in pursuing science is admirable and inspiring. I am very grateful for the invaluable theoretical and technical support they have provided to improve my understanding and this thesis. Leading by example, they have encouraged me to break out of my shell and explore science freely, instead of being a slave to my insecurities and self-doubt. In addition, I would like acknowledge MGU supporting staff specifically Kak Leen, Kak Pushpa, Mr. Izarul and Kak Sal, for the kindness and assistance they have provided in

matters relating to daily-workings of the lab and also for welcoming me every morning with a kind smile.

If I was asked what do I treasure the most throughout my MSc, my answer will always be my friends. I was truly blessed to meet and interact with exceptional individuals who have enriched my life in one way or another. Most of my learning and understanding came from the intense and extensive discussions, where my friends constantly sought to educate and challenge my thinking. Their drive and thirst for learning serves as my inspiration to improve myself every day. At times, life science research can exhaust a person physically and emotionally, dragging the person down to despair and hopelessness. Thankfully, my friends swooped in at the right moment, to assist, to offer support to the best of their abilities and offer words of encouragement to lift my spirit and make me hungry for science again. Moreover, they have created a safe haven for me that is filled with happiness, trust, and love. Family is not always blood-related. It's the people in your life who would do anything in to support and nurture you. Listing the following names is the least I can do to show my appreciation: Adila, Afiqah, Ahmed, Akram, Amin, Angeline, Aqilah, Arcana, Asraa, Asween, Atikah, Avin, Chai Ling, Elson, Eryse, Farizan, Fee Wai, Hadri, Hamizun, Han Chung, Hani, Haslinda, 'Izzati, Kai Leng, Kamal, Khair, Khairul, Marlini, Melati, Melissa, Melody, Nabila, Nadiah, Nadirah, Niu Jin, Radha, Rohayu, Rozita, Rusheni, Saadah, Shahidee, Shirley, Suleiman, Tay, Ummul, Usman, Wei Hong & Wendy. I rather walk with you in the dark than walk alone in the light (Adapted from Helen Keller).

Saving the last for the best, I am greatly indebted to my MSc supervisor, Assoc. Prof. Dr. Syahril Abdullah. I believe his performance as a remarkable supervisor stems from his paradoxical persona. He is aged yet youthful, witty yet stern, adventurous yet realistic, impartial yet caring, playful yet responsible, etc. Dr. Syahril's approach to educate "the way of" science is unique. When it comes to solving problems, instead of spoon-feeding the solutions, he gave my mind "wings" to freely explore solutions. When necessary, especially when I stray from the objective, he guides me back to the "right flight path" to prevent any "Icarus-like" incidence. Interestingly, he often contributes in-depth knowledge and insights when least expected. Importantly, communicating with him was simple and enjoyable as he is very approachable and treats everyone as an equal instead of enforcing his academic rank. These are the moments where I was able to exercise my intellectual freedom and develop my scientific inquiry skills. He taught various important skills such as scientific writing, data presentation and played a very essential role in completing this thesis. Moreover, he ensured that I am able to complete my project comfortably by securing continuous funding. Besides providing guidance in research, he took it upon himself to be my mentor to develop my career as a scientist. As such, he encouraged me to participate in outreach events, gain teaching experience by mentoring interns and undergraduates, and facilitated networking opportunities with established scientists. Honestly, there were times that I felt annoyed and irritated with him and sometimes we get into serious arguments. However, these are momentary as we are able to reconcile and accept our differences, mainly due to his open-mindedness. Basically, our supervisor-student relationship is akin to the scene where Yoda trains Luke in The Empire Strikes Back (1980). Throughout my time as an intern and a MSc candidate, he was a guide, teacher, role model, and a friend. I'm grateful for the opportunity to work under his supervision and if I were given the chance to go back in time, I would not change anything. (However, if a Nobel laureate offers me a spot, I'll change my supervisor in a heartbeat!).

Nevertheless, these are only words that do not do justice to the magnitude of my gratitude to all of you. I cannot repay your kindness and I pray that you always attain the best in your future undertakings.

P.S. I am grateful to the Ministry of Higher Education for awarding the MyBrain Scholarship, and Universiti Putra Malaysia for awarding Graduate Research Fellowship and Putra Graduate Initiative Grant (GP-IPS/2015/9455500) to fund my project.

I certify that a Thesis Examination Committee has met on 10 March 2017 to conduct the final examination of Muhammad Omar bin Habib Rahuman on his thesis entitled "CpG-Free Plasmid DNA Exhibits Limited *In Vitro* Reporter Gene Expression Due to Transcriptional Incongruity" in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The Committee recommends that the student be awarded the Master of Science.

Members of the Thesis Examination Committee were as follows:

#### Rozita binti Rosli, PhD Professor Institute of Bioscience Universiti Putra Malaysia (Chairman)

Cheah Yoke Kqueen, PhD Associate Professor Faculty of Medicine and Health Science Universiti Putra Malaysia (Internal Examiner)

Badrul Hisham Yahaya, PhD Professor Universiti Sains Malaysia Malaysia (External Examiner)

NOR AINI AB. SHUKOR, PhD Professor and Deputy Dean School of Graduate Studies Universiti Putra Malaysia

Date: 28 April 2017

This thesis was submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfillment of the requirement for the degree of Master of Science. The members of the Supervisory Committee were as follows:

## Syahril Abdullah, D.Phil

Associate Professor Faculty of Medicine and Health Science Universiti Putra Malaysia (Chairman)

### Ling King-Hwa, PhD

Senior Lecturer Faculty of Medicine and Health Science Universiti Putra Malaysia (Member)

## Chau De-Ming, PhD

Senior Lecturer Faculty of Medicine and Health Science Universiti Putra Malaysia (Member)

## **ROBIAH BINTI YUNUS, PhD** Professor and Dean School of Graduate Studies Universiti Putra Malaysia

Date:

## Declaration by graduate student

I hereby confirm that:

- this thesis is my original work;
- quotations, illustrations and citations have been duly referenced;
- this thesis has not been submitted previously or concurrently for any other degree at any other institutions;
- intellectual property from the thesis and copyright of thesis are fullyowned by Universiti Putra Malaysia, as according to the Universiti Putra Malaysia (Research) rules 2012;
- written permission must be obtained from the supervisor and the office of Deputy Vice-Chancellor (Research and Innovation) before thesis is published (in the form of written, printed or in electronic form) including books, journals, modules, proceedings, popular writings, seminar papers, manuscripts, posters, reports, lecture notes, learning modules or any other materials as stated in the Universiti Putra Malaysia (Research) Rules 2012;
- there is no plagiarism or data falsification/ fabrication in the thesis, and scholarly integrity is upheld as according to the Universiti Putra Malaysia (Graduate Studies) Rules 2012. The thesis has undergone plagiarism detection software.

#### **CHAPTER 1**

#### INTRODUCTION

The basic principle of gene therapy is to deliver nucleic acids into patients to treat or even cure a particular condition. The nucleic acids were delivered to ultimately modulate the expression of relevant gene(s) in target cells with the goal of treating a disease (Hsu & Uludağ, 2012). The two common clinical approaches in gene therapy are *in vivo*, where nucleic acids are delivered directly to the target cells or near the target cells in the patients, and *ex vivo*, where target cells are isolated from the patients and genetically modified *in vitro* before autologous transplantation (Naldini, 2011). Although the initial conception of gene therapy was mainly to treat incurable monogenic diseases, now gene therapy as a prospect for effective treatment strategy in medicine.

In order to deliver and facilitate the expression of nucleic acids, vectors are utilized. In fact, designing a safe and optimal vector is a major factor contributing to the success of gene therapy. Between the two most common gene therapy vectors, viral vectors are preferred over the non-viral plasmid DNA (pDNA) vectors due to their ability to efficiently transduce and deliver nucleic acids to the target cells. However, limitations of viral vectors in terms of production, cloning capacity and most importantly safety issues, such as insertional mutagenesis and immunological side effects (Chen et al., 2003; Thomas et al., 2003), which makes pDNA vectors an advantageous alternative (Tolmachov, 2011).

Recently, a pDNA known as the CpG-free pDNA (p0CpG) has emerged to be an efficient and safe vector. p0CpG was designed to be devoid of CpG (cytosine-guanine dinucleotide) motif from the whole pDNA that includes the pDNA backbone and the transgene. With depletion of the CpG motifs, the p0CpG was able to circumvent detrimental inflammatory response and provide sustained transgene expression in various pre-clinical studies by avoiding silencing by DNA methylation (Ando et al., 2012; Hyde et al., 2008). In addition, the clinical safety and efficacy of p0CpG was further reinforced with the significant treatment effect observed in Phase 2B cystic fibrosis gene therapy clinical trial with no significant adverse events (Alton et al., 2015). Interestingly, all reported studies using p0CpG were focused on *in vivo* approaches. Extending the p0CpG towards *ex vivo* approach would be a novel and highly beneficial strategy as this construct may provide sustained transgene expression by circumventing DNA methylation silencing effects.

C

However, to date, the evaluation of the p0CpG expression in *in vitro* model has never been reported. There is a need to validate the performance of p0CpG *in vitro* as *ex vivo* approach requires isolated cells to be genetically manipulated and validated *in vitro* before autologous transplantation. On the other hand, it was recently reported that CpG depletion from transgene resulted in limited *in vitro* transgene expression (Krinner et al., 2014). Even though this phenomenon was not studied on the p0CpG, there is a necessity to clarify this effect on p0CpG since CpG motifs are completely depleted from the whole pDNA, including the transgene, which could possibly affect the *in vitro* performance of this vector. Thus, the **problem statement** of this study is the assessment of the p0CpG performance *in vitro*, specifically the effect of CpG depletion from transgene, is necessary for future *ex vivo* gene therapy application.

Therefore, the **general objective** of this study is to evaluate the performance of p0CpG *in vitro*, specifically the effect of CpG depletion from the transgene. The **null hypothesis (H**<sub>0</sub>) proposed is the p0CpG will exhibit a superior *in vitro* expression profile despite having CpG-depleted transgene. Conversely, the **alternate hypothesis (H**<sub>1</sub>) is the p0CpG will exhibit limited *in vitro* expression profile due to CpG-depleted transgene.

The specific objectives of this study are:

- 1. To compare the *in vitro* expression of luciferase reporter gene in human cell lines between pDNAs that have been previously validated by *in vivo*, which are CpG-free pDNA and CpG-containing pDNA.
- 2. To construct novel pDNAs with identical CpG-free backbone carrying GFP alleles of variable CpG content as a tool to investigate the influence of pDNA backbone and transgene CpG content on transgene expression.
- 3. To determine external factors that could influence transgene expression of the constructed pDNAs, which include type of gene transfer agent, type and species of cells and pDNA-induced cytotoxicity.
- 4. To identify the levels in gene expression process that may limit pZGFP expression compared to pRGFP, specifically at the gene dosage and mRNA export levels.
