DEDICATION

This thesis is dedicated to

All patients who had participated in this project

For their support, cooperation and courage in making this study a reality and their families for the patience shown in the face of adversity.

My husband, Zainudin and four children Mawaddah, Munif, Muntasir and Mus'ad

For their continuous support, patience, understanding and sacrifice of family time from the beginning till the completion of this thesis.

The soul of my parents, Ujang bin Salleh and Sara binti Mahmud

Who had brought me up in this world with love and kindness and always inspired me to be a successful and learned person.

Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfilment of the requirements for the degree of Master of Science

Malnutrition is prevalent in head and neck cancer patients due to premorbid lifestyles, local effects of the tumor, and side-effects of the treatment. Malnutrition has been reported to have a negative impact on the quality of life of these patients while undergoing treatment. This study aims to determine the impact of nutritional status on quality of life of head and neck cancer patients undergoing radiotherapy (primary, adjunctive to surgery or combined with chemotherapy), as well as to identify the contributing factors to these parameters.

A cross-sectional study was carried out in a convenience sample of 50 head and neck cancer patients receiving radiotherapy (primary, adjunctive to surgery or combined with chemotherapy) who were admitted to the oncology wards, Hospital Kuala Lumpur. Nutritional status was assessed objectively by using combination of anthropometry, biochemical and dietary method, and subjectively (using Patient-Generated Subjective Global

Assessment or PG-SGA). Quality of life was evaluated by using the European Organization for Research and Treatment of Cancer Quality of Life Core Questionnaire (EORTC QLQ-C30 and its head and neck module (EORTC QLQ-H&N35).

Of 50 patients, 58% (n=29) were found to be malnourished by using objective criteria, while 84% (n=42) were found to be malnourished by using subjective measure (PG-SGA). Poor quality of life was reported in 56% of the patients. None of the sociodemographic factors studied was associated with malnutrition. Bivariate analysis showed that two clinical variables (treatment type and radiation dosage) significantly affected nutritional status. Chemoradiated patients were found to be more malnourished than those treated with radiotherapy alone or post-operative radiotherapy ($F= 7.832$, $p<0.05$). Multivariate analysis revealed that neoadjuvant chemoradiation and post-operative radiotherapy significantly affected nutritional status ($F = 12.085$, $p= 0.000$, $R^2= 0.340$). Both contributed 34% of the variance seen in the nutritional status of the patients.

In terms of QoL, 56% of patients had poor QoL. Bivariate analysis showed that treatment modality and nutritional status were significantly associated with QoL. Post-operative radiotherapy was associated with better quality of life, followed by those treated with radiotherapy alone, neoadjuvant chemoradiation and concurrent chemoradiation ($F= 6.721$, $p<0.05$). As

anticipated, malnourished patients had significantly poorer QoL (Mann-Whitney test = 66.5, $p < 0.05$). However, multivariate analysis revealed that nutritional status was not a significant contributor of QoL. The only two significant contributors of QoL were household income and post-operative radiotherapy, and both explained about 40% of the variance seen in the QoL of the patients ($F = 14.901$, $p = 0.000$, $R^2 = 0.398$).

In short, the results of this study has highlighted that malnutrition was very prevalent in head and neck cancer patients. The findings also provide an insight into factors that contribute to both nutritional status and QoL. A longitudinal study is needed in order to determine the real effect of treatment over time in both nutritional status and QoL of the patients.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia
sebagai memenuhi keperluan untuk ijazah Master Sains

**KESAN STATUS PEMAKANAN TERHADAP KUALITI HIDUP
PESAKIT KANSER KEPALA DAN LEHER YANG MENJALANI
RADIOTERAPI**

Oleh

Noriati binti Ujang

Julai 2009

Pengerusi: Mirnalini Kandiah, PhD

Fakulti: Perubatan dan Sains Kesihatan

Masalah malpemakanan adalah sangat ketara di kalangan pesakit kanser kepala dan leher yang berpunca daripada gaya hidup sebelum sakit, lokasi tumor dan kesan sampingan rawatan. Masalah malpemakanan telah dilaporkan sebagai memberi kesan negatif terhadap kualiti hidup pesakit semasa menjalani rawatan. Kajian ini bertujuan untuk menentukan kesan status pemakanan ke atas kualiti hidup pesakit semasa menjalani rawatan radioterapi (primer, pasca pembedahan atau kombinasi bersama kemoterapi) serta mengenalpasti faktor-faktor penyumbang kepada kedua-dua parameter tersebut.

Satu kajian keratan rentas telah dijalankan ke atas 50 orang pesakit yang menjalani rawatan radioterapi (primer, pasca pembedahan atau kombinasi bersama kemoterapi) di wad onkologi, Hospital Kuala Lumpur. Status pemakanan dinilai secara objektif menggunakan kombinasi kriteria

antropometri, biokimia dan diet, dan secara subjektif (menggunakan Penilaian Subjektif Global Janaan Pesakit atau PG-SGA). Kualiti hidup dinilai menggunakan borang kaji selidik “European Organization for Research and Treatment of Cancer Quality of Life Core Questionnaire (EORTC QLQ-C30)” dan modul kanser kepala dan leher (EORTC QLQ-H&N35).

Daripada 50 orang pesakit, 58% (n=29) mengalami malpemakanan berdasarkan kaedah objektif, manakala 84% (n=42) mengalami malpemakanan berdasarkan kaedah subjektif. Tiada perkaitan diantara faktor sosiodemografi yang dikaji dengan status pemakanan. Analisis bivariat menunjukkan hanya faktor jenis rawatan mempunyai perkaitan beerti dengan status pemakanan. Pesakit yang menjalani kemoradiasi didapati lebih cenderung mengalami malpemakanan berbanding mereka yang menjalani radioterapi sahaja atau radioterapi pasca-pembedahan ($F=7.832$, $p<0.05$). Hasil analisis lanjut mendapati bahawa status pemakanan hanya dipengaruhi oleh jenis rawatan sahaja iaitu kemoradiasi neoadjuvan dan radioterapi pasca pembedahan ($F=12.085$, $p=0.000$, $R^2=0.340$). Kedua-dua faktor menyumbang sebanyak 34% kepada varians status pemakanan pesakit.

Manakala bagi kualiti hidup pula, 56% daripada pesakit melaporkan kualiti hidup yang rendah. Analisis bivariat menunjukkan jenis rawatan dan status pemakanan mempengaruhi kualiti hidup secara signifikan. Rawatan

radioterapi pasca pembedahan dikaitkan dengan kualiti hidup yang lebih tinggi diikuti oleh rawatan radioterapi, kemoradiasi neoadjuvan dan kemoradiasi serentak ($F= 6.721, p<0.05$). Seperti yang dijangka, pesakit yang mengalami malpemakanan mempunyai kualiti hidup yang lebih rendah secara signifikan (Ujian Mann-Whitney = 66.5, $p<0.05$). Walaubagaimanapun, analisis lanjut menunjukkan status pemakanan tidak menyumbang secara signifikan kepada kualiti hidup. Hanya dua faktor iaitu pendapatan isi rumah dan radioterapi pasca pembedahan mempengaruhi kualiti hidup secara signifikan ($F=14.901, p=0.000, R^2=0.398$). Kedua-dua faktor menyumbang hampir 40% kepada varians kualiti hidup pesakit.

Kesimpulannya, kajian ini menunjukkan bahawa malpemakanan adalah sangat ketara di kalangan pesakit kanser kepala dan leher. Hasil kajian turut memberi petunjuk kepada faktor-faktor yang mempengaruhi status pemakanan dan kualiti hidup. Kajian jangka panjang diperlukan bagi melihat kesan sebenar rawatan terhadap status pemakanan dan kualiti hidup pesakit.

ACKNOWLEDGEMENTS

First and foremost, all praises to Allah the Almighty for giving me the strength and utmost courage to complete this thesis. It is by His wish that this humble work has been completed.

My sincere appreciation goes to my main supervisor, Dr Mirnalini Kandiah for her sincere commitment, dedication and guidance in advising and assisting me in the accomplishment of this thesis. Without her support and extended patience, this study would not have been possible. My sincere gratitude also goes to my co-supervisors, Dr Zalilah Mohd Sharif and Dr Zabedah Hj Othman for their constructive opinions and guidance throughout the project. I also owe special thanks to Dr Bahaman Abu Samah for his assistance and patience in helping me with the statistical analyses.

Very special thanks and appreciation are expressed to Dr Ros Suzana, radiographers and nursing staffs of the Radiotherapy and Oncology Department, Hospital Kuala Lumpur for their cooperation and kind support during the data collection period. Very sincere and special appreciation also goes to the patients and their families for their invaluable cooperation, kindness and courage in making the data collection a success.

A sincere thanks also goes to the Molecular Diagnostics and Protein Unit Head, Norsiah Md Desa and her dedicated laboratory staffs in the Institute

of Medical Research (IMR) for extending generous help and support when I was conducting the prealbumin tests in their facility.

Special appreciation is also expressed for all librarians from Universiti Putra Malaysia (UPM) and Universiti Kebangsaan Malaysia (UKM) for their assistance in retrieving relevant references and reading materials to complete this thesis.

I am also indebted to the Public Services Department of Malaysia for giving me an opportunity to learn and providing me with financial assistance to pursue my studies in UPM. Special gratitude is also expressed to Ministry of Health Malaysia for allocating a grant to fund this project.

I am indebted most of all to my beloved husband, Zainudin Ismail and my four children, Mawaddah, Munif Ansari, Muntasir Arif and Mus'ad Amjad, for their patience, utmost support and understanding without which the thesis could not have been completed. Heartfelt thanks are also extended to my sisters and brothers, my parents-in-law, Ismail Mohd and Kelsom Salleh and all family members for their support and prayers for my success.

I would also like to express my sincere thanks to all my colleagues in Hospital Kuala Lumpur and especially for head department Tan Yoke Hwa, and Ridzoni Sulaiman, for their support in assisting me to complete this

work. Sincere gratitude also goes to my colleague in HUKM (Ms Nurul Huda), my graduate friends in UPM especially for Hasmah, Hasnah and Amutha for their moral support and help.

To all of them, may Allah reward with His bounties and bless their kindness, patience and dedication. Thank you.

I certify that an Examination Committee met on 9th July 2009 to conduct the final examination of Noriati binti Ujang on her Master of Science thesis entitled "Nutritional Status and Quality of Life in Head and Neck Cancer Patients Undergoing Radiotherapy" in accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1980 and Universiti Pertanian Malaysia (Higher Degree) Regulations 1981. The committee recommends that the candidate be awarded the relevant degree. Members of the Examination Committee are as follows:

Mary Huang, Ph.D.
Associate Professor
Faculty of Medicine and Health Sciences
Universiti Putra Malaysia
(Chairman)

Zarida Hambali, Ph.D.
Associate Professor
Faculty of Medicine and Health Sciences
Universiti Putra Malaysia
(Member)

Chan Yoke Mun, Ph.D.
Lecturer
Faculty of Medicine and Health Sciences
Universiti Putra Malaysia
(Member)

Winnie Chee Siew Swee, Ph.D.
Associate Professor
International Medical University
(External Examiner)

BUJANG KIM HUAT, Ph.D.
Professor/Deputy Dean
School of Graduate Studies
Universiti Putra Malaysia

Date:

This thesis submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfilment of the requirements for the degree of Master of Science. The members of the Supervisory Committee were as follows:

Mirnalini Kandiah, PhD

Faculty of Medicine and Health Sciences
Universiti Putra Malaysia
(Chairperson)

Zalilah Mohd Sharif, PhD

Faculty of Medicine and Health Sciences
Universiti Putra Malaysia
(Member)

Zabedah Hj Othman, MD

Consultant Clinical Oncologist
Hospital Kuala Lumpur
(Member)

HASANAH MOHD GHAZALI, PhD

Professor and Dean
School of Graduate Studies
Universiti Putra Malaysia

Date: 16 October 2009

DECLARATION

I hereby declare that the thesis is based on my original work except for quotations and citations which have been duly acknowledged. I also declare that it has not been previously or concurrently submitted for any other degree at UPM or other institutions.

NORIATI BINTI UJANG

Date : 9 November 2009

GLOSSARY OF TERMS

1. **Head and neck cancers** - refer to a group of biologically similar malignant cancers arising from the upper aerodigestive tract (UADT) which include the lip, oral cavity (mouth), nasal cavity, paranasal sinuses, pharynx, and larynx (Sanderson & Montague, 2004, Rhys Evans & Patel, 2003). Majority (90%) are squamous cell carcinomas.
2. **Squamous cell carcinomas (SCC)** - tumors arising from the mucosal linings of the upper aerodigestive tract, which are the major types in head and neck cancers (Sanderson & Montague, 2004).
3. **Oral cavity** - the mouth
4. **Nasal cavity** - the passageway just behind the nose through which air passes on the way to the throat during breathing (Cleveland Clinic, 2005)
5. **Paranasal sinuses** - small hollow spaces around the nose lined with cells that secrete mucus communicating with the nasal cavity, within the bones of the skull and face (Cleveland Clinic, 2005).
6. **Oral cavity cancer** - cancer that forms in tissues of the lip or mouth. This includes the front two thirds of the tongue, the upper and lower

gums, the lining inside the cheeks and lips, the bottom of the mouth under the tongue, the bony top of the mouth, and the small area behind the wisdom teeth (Siteman Cancer Centre, 2008).

7. **Nasopharyngeal carcinoma** - cancer originating in the nasopharynx, the passageway at the back of the nose, which connects the nose to the pharynx and acts as a shared passageway for air and food (Gale Encyclopedia of Cancer, 2006).

8. **Oropharyngeal carcinoma** - cancer that develops in the part of the throat just behind the mouth, called the oropharynx. Sometimes this is called throat cancer. The oropharynx begins where the oral cavity stops. It includes the base of tongue (the back third of the tongue), the soft palate (the back part of the roof of the mouth), the tonsils, and the side and back wall of the throat (American Cancer Society, 2007).

9. **Laryngeal carcinoma** - cancer originating from the larynx (often called the "voice box" or "Adam's apple"). For the purpose of tumour staging, it is divided into three levels -- the glottis (or the vocal cords), the supraglottis (the area above the vocal cords including the epiglottis), and the subglottis (the area below the vocal cords) (Swierzewski, 2008).

10. **Radiotherapy** - the use of ionizing radiation for the treatment of malignant disease. It comprises both external beam therapy and brachytherapy. *External beam therapy* uses a machine, for example deep X-ray set or linear accelerator as the source of radiation. *Brachytherapy* - uses radioactive material sealed in needles or catheters and placed directly or near to the tumors (also known as "implant radiation") (Rhys Evans *et al.*, 2003).

11. **Radiation dosage** - the quantity of ionizing radiation energy absorbed per unit mass of tissue. The SI unit of absorbed dose is the gray (Gy), defined as an energy absorption of 1 joule/kg. Other unit used is rads (100 rads = 1 Gy) (Rhys Evans *et al.*, 2003).

12. **Fractionation** - the division of total dose of radiotherapy (external beam therapy) into a number of smaller doses delivered over a period of several weeks. The aim is to increase the differential effect of the radiation on the tumor compared with the normal tissues. The standard fractionation which is generally accepted is 1.8-2 Gy/fraction, 5 days per week to a total dose of 66-70 Gy in an overall treatment time of 6.5-7 weeks. (Rhys Evans *et al.*, 2003).

13. **Chemotherapy** - the use of potent anti-cancer drugs to treat cancerous cells. In most cases, chemotherapy works by interfering with the cancer cell's ability to grow or reproduce (NHS Direct, 2008).

14. **Chemoradiation** - treatment that combines radiotherapy and chemotherapy. The drugs may be given before radiotherapy (neoadjuvant or induction chemotherapy) or during radiotherapy (concurrent or synchronous chemotherapy) (Henk, 2003).

15. **Nutritional impact symptoms** - refer to symptoms arising from adverse effects of treatment which impair food intake. Chemotherapy causes nausea, vomiting, diarrhea and *mucositis* (irritation or ulceration of the mucosa lining of the digestive tract particularly the tongue, mouth, and throat). Radiotherapy to head and neck areas causes:

- *Xerostomia* - dry mouth
- *Dysphagia* - difficulty in swallowing
- *Odynophagia* - pain on swallowing
- *Ageusia* - loss of taste
- *Dysosmia* - altered sense of smell
- *Hypogeusia* - diminished sense of taste
- *Dysgeusia* - altered sense of taste

(Ottery, 1995; Wojtaszek *et al.*, 2002)

16. **Enteral or tube feeding** - provision of nutrition via tube to the digestive tract to a patient who cannot take in, chew, or swallow food but who can digest and absorb nutrients. Different types of tubes can be used for feeding. A tube which is placed through the nose into the stomach or bowel is called a nasogastric or nasoenteral feeding tube. Sometimes the tube is placed directly through the skin into the stomach or bowel. This is called a gastrostomy or jejunostomy (ASPEN, 2006).

17. **Quality of life** - a subjective multidimensional construct representing functional status, psychosocial well-being, health perceptions and disease/treatment-related symptoms (Ferrell BR *et al.*, 1996)

18. **Age-standardized incidence rate** - a summary measure of a rate that a population would have, if it had a standard age structure. Standardization is necessary when comparing several populations that differ with respect to age because age has such a powerful influence on the risk of cancer. The most frequently used standard population is the World standard population. The calculated incidence rate is then called the World Standardized incidence rate. It is also expressed per 100,000 (IARC, 2005).
