

Concentration effect of Zinc Acetate dihydrate as precursor in preparing Zinc Selenide through hydrothermal method

ABSTRACT

Zinc Selenide has been synthesized through hydrothermal method using Zinc Acetate Dihydrate ($\text{Zn}(\text{O}_2\text{CCH}_3)_2(\text{H}_2\text{O})_2$) and Se powder as the precursor. In a typical synthesis, Zn^{2+} and Se^{2-} ion have been prepared separately and charged into a teflon-lined stainless steel autoclave. The ZnSe are characterized by X-ray diffraction (XRD), Field Emission Microscopy (FESEM), ultraviolet–visible spectroscopy (UV-Vis) and photoluminescence (PL). From the Pure ZnSe with main XRD peak at $2\theta = 27.29^\circ$, 45.30° , 53.62° , 65.88° , 72.68° has been synthesized with the optical band gap energy (E_g) of 2.50 eV with emission peak at 486 nm.
