## Corrosion inhibition studies of cashew nut (*Anacardium occidentale*) on carbon steel in 1.0 M hydrochloric acid environment

## **ABSTRACT**

The corrosion inhibitive characteristics of the cashew nut (*Anacardium occidentale*) were studied as an eco-friendly green corrosion inhibitor at ambient temperature of 25 °C using weight loss analysis and adsorption isotherms. The effect of inhibitor concentration (4–12 g/l) at immersion time of 3–12 days was evaluated. The inhibitive ability of cashew nut shows a significant inhibition efficiency of 86% at 12 g/l concentration for 3-days and 72.9% at 12-days, which are undoubtedly as a result of the absorption of the inhibitor molecules on the metal surface which serve as a barrier against corrosion of carbon steel in acidic medium. The adsorption mechanism was found to fit Tempkin isotherms. The average optimum free energy of absorption was calculated to be –17.374 kJ mol<sup>-1</sup> indicating that the process was exothermic and physisorption.
