DEDICATION

I would like to dedicate this work to those who taught, motivated and helped me throughout my study.

To my respected father late Md. Jahangir Hossain who always dreams for my study in abroad and my mother most. Gulshan Ara Begum who sacrificed her valuable time and always keep praying for me day and night to achieve my goal and to all my friends, teacher and colleague who supported me all those past years.

Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfillment of the requirement for the degree of Master of Science

NITROGEN, PHOSPHORUS AND COMPOST APPLICATION EFFECTS ON THE GROWTH, YIELD AND SEED QUALITY OF BAMBARA GROUNDNUT

By

MD. MAHMUDUL HASAN

June 2018

Chairman : Md. Kamal Uddin, PhD
Faculty: Agriculture

Bambara groundnut (*Vigna subterranea*) is an indigenous African crop. Its seeds contain 63% carbohydrate, 19% protein, 6.5% oil and good source of fibre, calcium, iron and potassium. Hence, this study aimed to determine the effect of nitrogen (N), phosphorus (P) and compost on growth, yield and seed quality of bambara groundnut. Two pot experiments were conducted in Ladang15 at the Faculty of Agriculture, Universiti Putra Malaysia. Both of the experiments were arranged in a Randomized Complete Block Design. The first experiment was conducted in a factorial design with four levels of N (0, 10, 20, 30 kg ha⁻¹) and P (0, 20, 40 and 60 kg ha⁻¹). The second experiment was conducted using different levels of nitrogen, phosphorus, compost, biofertilizer and gypsum. Mineral composition of the seed was determined by dry ashing method. Amino acid content in the seed was determined by HPLC. Fiber determination was carried out by utilizing fibertec system. An extraction of lipid was utilized by using soxtec system. In the first experiment, the vegetative growth of the plant i.e. plant height (20.65 cm), leaves number (262), branch number (86.50) and leaf area (2140.54 cm²) was attained at N and P (N₃₀ + P₆₀ kg ha⁻¹) application. The maximum pod number per plant (47.25) was attained in the treatment of T₁₆ (N₃₀ and P₆₀ kg ha⁻¹) i.e. the highest amount of N and P application. From the results, it is revealed that the seed of bambara groundnut contains 20.30% protein, 5.01% fibre, cysteine 11.3 mg kg⁻¹, alanine 42.5 mg kg⁻¹, 663.3 mg kg⁻¹ Ca, and 650.5 mg kg⁻¹ Mg. In the second experiment, compost, biofertilizer, gypsum was used along with the combination of N and P (two best selected treatments from the first study and also recommended dose of N and P). In this study, N and P fertilizers played dominating role for vegetative growth of the plant. Plant height (21.73 cm), leaves number (265.50) and leaf area (2802.9 cm²) increased with the application of highest level of N and P i.e. T₁ (control) (N₃₀ + P₆₀ kg ha⁻¹) application. The maximum number of pod (41.75) and highest pod weight (49.68 g) were also attained by T₁ (N₃₀ + P₆₀ kg ha⁻¹). Protein 19.95%, fiber 5.20%, histidine 30 mg kg⁻¹, methionine 14.8 mg kg⁻¹, potassium 448.8 mg kg⁻¹ and manganese 24.4 mg kg⁻¹ were contained in the seed of bambara groundnut. From the two experiments, it is presented that application of compost and different levels of fertilizer had no major changes in the nutritional value of bambara groundnut. However, the application of N₃₀ and P₆₀ kg ha⁻¹ fertilizer, vegetative growth and yield of the plant was better than all other treatments in both experiments. For

getting maximum growth, yield and seed quality of bambara groundnut N_{30} kg ha⁻¹ and P_{60} kg ha⁻¹ could be recommended.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Master Sains

**KESAN NITROGEN, FOSFORUS DAN KOMPOS KE ATAS
PERTUMBUHAN, HASIL DAN KUALITI BIJI BENIH POKOK KACANG
BAMBARA**

Oleh

MD. MAHMUDUL HASAN

Jun 2018

Pengerusi : Md. Kamal Uddin, PhD

Fakulti : Pertanian

Kacang bambara (*Vigna subterranea*) ialah tanaman yang berasal dari Afrika. Biji benihnya mengandungi 63% karbohidrat, 19% protein dan 6.5% minyak dan merupakan sumber serat, kalsium, zat besi dan kalium. Oleh itu, kajian ini mengkhususkan tentang penentuan kesan nitrogen, fosforus dan kompos ke atas pertumbuhan, hasil dan kualiti biji benih kacang bambara. Dua eksperimen rumah kaca telah dijalankan di Ladang 15, Fakulti Pertanian, Universiti Putra Malaysia. Kedua-kedua eksperimen dijalankan menggunakan rekabentuk blok rawak lengkap (RBRL). Eksperimen pertama dilakukan dalam bentuk factorial melibatkan empat kadar nitrogen (0, 10, 20, 30 kg ha⁻¹) and fosforus (0, 20, 40 and 60 kg ha⁻¹). Eksperimen kedua pula dijalankan dengan menggunakan kadar nitrogen, fosforus, kompos, biobaja dan gipsum yang berbeza. Komposisi mineral biji kekacang ini telah dianalisis menggunakan kaedah “dry ashing” manakala kandungan asid amino telah ditentukan dengan HPLC. Penentuan serat dilakukan dengan menggunakan sistem fibertec. Pengekstrakan lipid telah digunakan dengan menggunakan sistem soxtec. Dalam eksperimen pertama, pertumbuhan vegetative pokok iaitu tinggi pokok (20.65 cm), jumlah daun (262), jumlah dahan (86.50) dan luas daun (2140.54 cm²) telah terhasil dengan penggunaan N dan P padakadar N₃₀ dan P₆₀ kg ha⁻¹. Jumlah maksimum pod setiap pokok (47.25) terhasil daripada rawatan T₁₆ (N₃₀ dan P₆₀ kg ha⁻¹) iaitu penggunaan N dan P yang terbanyak. Hasil kajian ini menunjukkan bahawa biji benih kacang bambara mengandungi 20.30% protein, 5.01% serat, 11.3 mg kg⁻¹ cysteine, 42.5 mg kg⁻¹ alanine, 663.3 mg kg⁻¹ Ca dan 650.5 mg kg⁻¹ Mg. Dalam eksperimen kedua, kompos, biobaja dan gypsum telah digunakan bersama-sama dengan kombinasi N dan P (dua rawatan terbaik daripada kajian pertama dan juga kadar N dan P yang disyorkan). Dalam kajian ini, baja, N dan P mendominasi peranan untuk pertumbuhan vegetative pokok. Tinggi pokok (21.73 cm), jumlah daun (265.50) dan luas daun (2802.9 cm²) meningkat dengan aplikasi N dan P yang tertinggi iaitu T₁ (kawalan) (N₃₀ + P₆₀ kg ha⁻¹). Jumlah maksimum pod (41.75) dan berat pod (49.68 g) yang tertinggi juga terhasil daripada rawatan T₁ (N₃₀ + P₆₀ kg ha⁻¹). Protein 19.95%, serat 5.20%, histidine 30 mg kg⁻¹, methionin 14.8 mg kg⁻¹, kalium 448.8 mg kg⁻¹ dan mangan 24.4 mg kg⁻¹ terkandung dalam biji benih kacang bambara. Dua eksperimen ini jelas menunjukkan aplikasi kompos dan kadar baja yang berbeza tidak mempengaruhi secara

ketara nilai nutrisi kacang bambara. Tetapi, aplikasi baja sebanyak N_{30} kg ha⁻¹ dan P_{60} kg ha⁻¹ menyebabkan pertumbuhan vegetative dan hasil pokok yang lebih berbanding rawatan yang lain dalam kedua-dua eksperimen. Untuk mendapatkan pertumbuhan maksimum hasil dan kualiti biji benih bambara N_{30} kg ha⁻¹ dan P_{60} kg ha⁻¹ boleh disyorkan.

ACKNOWLEDGEMENTS

First and foremost, I am most grateful to Almighty for giving me the strength and courage to complete the writing of this thesis within the period given. I am eternally grateful to my supervisor, Dr. Md. Kamal Uddin for his advice and guidance throughout the period of the thesis. I am very much indebted to him for his unwavering support, guidance and valuable advice in completing this thesis. Without his counsel, this thesis would not be able to achieve its objective.

I would like to thank my supervisory committee members for their advice, Prof. Dr. Mahmud Tengku Muda Mohamed, Dr. Ali Tan Kee Zuan. Especially Dr. Md. Kamal Uddin, without his quality and friendly guideline, this work would not have come to completion.

Last but not least, many thanks to staff of Land Management Department and Institute of Tropical Agriculture for their assistance and cooperation which led to the smooth running of this experiment.

Thank you.

I certify that an examination committee has met on 1 June 2018 to conduct the final examination of Md. Mahmudul Hasan on his Master of Science thesis entitled “Nitrogen, Phosphorus and Compost Application Effects on Growth, Yield and Seed Quality of Bambara Groundnut” in accordance with Universiti Pertanian Malaysia (Higher Degree) act 1980 and Universiti Pertanian Malaysia (Higher Degree) regulations 1981. The committee recommends that the candidate be awarded the relevant degree

Members of the examination committee were as follows:

Rasedee @ Mat bin Abdullah, PhD

Professor

Faculty of Veterinary Medicine

Universiti Putra Malaysia

(Chairman)

Anjas Asmara @ Ab. Hadi bin Samsudin, PhD

Associate Professor

Faculty of Veterinary Medicine

Universiti Putra Malaysia

(Internal Examiner)

Wan Zahari Mohamed, PhD

Professor

Universiti Malaysia Kelantan

CHAPTER 1

INTRODUCTION

Bambara groundnut (*Vigna subterranean*) is an African leguminous crop. This crop is also cultivated in many other countries as the most important and efficient pulse crop. It has the ability to resist disease, drought and also to produce a good yield in the poor soils. Bambara groundnut seeds contain enough carbohydrate, protein and fat to make it as a complete food (Kwaga *et al.*, 2015).

Bambara groundnut responds positively on many agronomic parameters with the application of nitrogen fertilizer. Nitrogen stability is the quality of fixed N minus and amount of nitrogen detached in collected grain (Idikut *et al.*, 2011) and is a determinant of the net nitrogen input of legumes to soil nitrogen. The condition of nitrogen in the legume is affected then nodulation is also being affected.

Following nitrogen, phosphorus is considered as a crucial mineral fertilizer for the production of the crop. In the plant, during its basic functions it manipulates the development of the nodule. Many physiological factors in the legume like photosynthesis, growth of the root, sugar translocation are directly or indirectly manipulated by phosphorus. In the soil, phosphorus is remaining as a key constituent and produced phosphate mineral (Marschner, 2012). For the successful crop production there is numerous information on the use of inorganic fertilizer and this information also has a preference that the use of inorganic fertilizer is beneficial for the growth and productivity of the crops.

Organic fertilizer has positive effects and enhances the nutrient availability in the soil (Islam *et al.*, 2016). Compost is well recognized among all the organic fertilizers. In the soil, compost supplies many nutrients, organic matters and also microorganisms which are useful and these things develop the health of the crop growth, quality and yields. In the degraded and low fertility soil, it can get better in the characteristics of soil and also a good source of N, P and K for the plant (Aziz *et al.*, 2017).

Bambara groundnut is not only cultivated as a single stand but also it can be grown intercropped with many other crops. In the light soil the harvesting of bambara groundnut is not so difficult. Vegetative growth of the plant is higher in the soil which is rich in N and for that reason seed production is hampered (Adegbola and Bamishaiye, 2011). The condition of getting the higher yield in bambara groundnut plant is the preparation of a good seed bed and also the field is extremely ploughed. It gains maximum size and also starts to form pods within 30 days after the application of fertilizer.

The most important characteristics of the seed are generally viability, storability and vigor. The seed can be eaten at mature and immature stage also. Bambara groundnut seed also is eaten after boiling. The method of cooking of seed is very easy (Berchie *et al.*, 2010). The seed contain 65% carbohydrate, 18% protein and 6.5% of fat and also the amount of calcium, fibre, iron and potassium is also good. Amount of protein is high in the seed of bambara groundnut (Massawe *et al.*, 2005). Bambara groundnut seed also contain a good amount of protein, moisture, fat, ash and total carbohydrate are 16, 9.7, 5.9, 2.9 and 64.9 percent, respectively. The seed of bambara groundnut is believed as a balance human diet because its full of nutritional value (Mazahib *et al.*, 2013).

There are many studies on bambara groundnut on its abilities to withstand drought stress but less about the level of nitrogen, phosphorus and compost to get optimum growth, yield and seed quality specifically in Malaysia. Research priorities need to be simplified in order to get the development of some underutilized crops, like bambara groundnut.

The objectives of this experiment were as following:

1. To determine the effect of N and P application rates on the growth, yield and seed quality of bambara groundnut.
2. To evaluate the effect of selected application rates of N, P and compost on the growth, yield and seed quality of bambara groundnut.
