Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfilment of the requirement for the degree of Doctor of Philosophy

LITTERFALL, NUTRIENTS AND FISHERY PRODUCTION IN KUALA SIBUTI MANGROVE, MALAYSIA

By

MOHAMMED MUZAMMEL HOQUE

August 2015

Chairman : Abu Hena Mustafa Kamal, PhD
Faculty : Agriculture and Food Sciences (Bintulu)

Research on ecological productivity of pristine mangroves in Sarawak is scanty. This study was carried out to determine some of the important attributes of ecological productivity, especially litterfall, nutrients release through decomposition, sediment productivity, nutrient inputs from different sources, fisheries diversity and production of undisturbed Kuala Sibuti mangrove, Sarawak, Malaysia from January 2013 to March 2014. Three sampling plots, each 100 m × 100 m (river mouth, middle and last part of the forest) were established considering the structure, density and topography of the mangrove to represent the whole forest for collection of data and information related to this study.

Annually 1640.82 g/m² dry weight of litterfall was estimated, of which *Rhizophora apiculata* contributed 92.94%, followed by *Xylocarpus granatum* (4.01%) and other species (3.05%). Total litterfall of both the species did not vary seasonally and the litterfall production of this forest was higher compared to other *R. apiculata* dominated tropical mangroves of the world. Monthly total litter standing crop correlated negatively ($r=-0.58$, $p<0.05$) with number of high tide that flooded, suggesting that tidal frequency determines the amount of litter remains on the forest floor. The decay constants (k) of almost all the litter components of the two species varied among the components and between the species. The half-life ($T_{50\%}$) and 95% lifespan ($T_{95\%}$) of non-leafy components such as flower, propagule, stipule and twig of both the species were remarkably high compared to the leaf. The slow decay rates of maximum litter components of the species positively correlated with the higher content of lignin, suggesting significant influence of lignin on the rate of litter decomposition. The order of nutrients release from the various litter components of the species was leaf > flower > propagule > stipule > twig.

The annual rate of tidal sediment accumulation in the mangrove was 0.93 g/cm². The monthly accumulation of sediments correlated positively ($r=0.69$) with the rate of monthly rainfall. The tidal sediments were relatively rich in texture, organic matter, organic carbon, cation exchange capacity and nutrients. The nutrient contents were also higher in the tidal borne sediments compared to the surface (0-5 cm) and deeper (30-50 cm) soils of the study area. In general, highly significant positive correlation between the sediment nutrients and corresponding nutrient contents in the components (leaf, stipule, flower, propagule, stem, bark and root) of *R. apiculata* and *X. granatum* trees,

saplings and seedlings indicates the nutritive roles of tidal borne sediments in the productivity of this mangrove ecosystem.

Nutrients of surface soil, especially C, N, P, K, Na and S correlated positively with the nutrients of deeper soil. Pore and river water nutrients (NH_4^+ , NO_3^- , PO_4^- , K, Ca, Mg and Na) of this forest were higher in the dry season and NH_4^+ , Ca, Mg and Na of pore water correlated positively with the nutrients of river water. Although the overall nutrient contents were higher in the surface soil, most of the nutrients, especially P, S, Mg and Na of deeper soil correlated positively with the corresponding nutrient contents of plant components of the two species, suggesting the plants uptake more nutrients from the root zone of the deeper soil. The lower C/N ratio is related to higher nutrition. Relatively lower C/N ratio was found in all the components of *R. apiculata* trees (47-104), saplings (42-81) and seedlings (41-60) than that of *X. granatum* trees (47-146), saplings (44-95) and seedlings (30-60) components. This suggests that the dominant species *R. apiculata* plays the important roles in the nutrient dynamics of Kuala Sibuti mangrove forest.

Kuala Sibuti mangrove estuary is relatively species rich in terms of fishery production and diversity, comprising 60 species from 32 families. Among all the species, *Coilia dussumieri* was the most dominant species (22.63%) followed by *Nemapteryx caelata* (11.85%), *Otolithes ruber* (7.85%) and *Ilisha elongata* (5.80%). The diverse species composition of fishery resources in this estuary could be due to favorable hydro-biological factors as well as enormous detritus and nutrients supplied from the mangrove forest. The findings of this study acknowledge that ecologically Kuala Sibuti mangrove is a highly productive ecosystem. The dominant species *R. apiculata* plays the key roles behind its productivity. The outcomes of this study would be useful for the scientific community to conduct further in depth research in various dimensions as well as to realize the importance of pristine mangrove forests.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk Ijazah Doktor Falsafah

**GUGURAN SISA, NUTRIEN DAN PRODUK PERIKANAN DI PAYA BAKAU
KUALA SIBUTI, MALAYSIA**

Oleh

MOHAMMED MUZAMMEL HOQUE

Ogos 2015

Pengerusi : Abu Hena Mustafa Kamal, PhD
Fakulti : Sains Pertanian dan Makanan (Bintulu)

Kajian mengenai produktiviti ekologi paya bakau asli di Sarawak adalah kurang. Kajian ini telah dijalankan bagi menentukan sebahagian daripada kepentingan produktiviti ekologi, terutamanya guguran daun, pelepasan nutrien melalui penguraian, produktiviti mendapan, input nutrien daripada sumber berbeza, kepelbagaian perikanan dan pengeluaran di paya bakau asli Kuala Sibuti, Sarawak dari Januari 2013 hingga Mac 2014. Tiga kawasan persampelan, setiap satu 100 m × 100 m (muara sungai, tengah dan hulu bahagian hutan) telah dilakukan dengan mengambilkira struktur, kepadatan dan topografi bakau mewakili keseluruhan hutan bagi pengumpulan data dan maklumat berkaitan dengan kajian ini.

Secara tahunan, 1640.82 g/m² berat kering guguran daun telah dianggarkan, yang mana *Rhizophora apiculata* menyumbang 92.94%, diikuti oleh *Xylocarpus granatum* (4.01%) dan spesies-spesies lain (3.05%). Jumlah guguran sisa bagi kedua-dua spesies tidak berbeza dari segi musim dan pengeluaran sisa bagi hutan ini adalah tinggi berbanding bakau tropika dunia yang dipenuhi oleh *R. apiculata*. Jumlah sisa dirian pokok pada setiap bulan adalah berhubungkait secara negatif ($r=-0.58$, $p<0.05$) dengan jumlah air pasang yang membanjiri, di mana kekerapan pasang surut air menentukan jumlah sisa tertinggal di atas permukaan lantai hutan. Pemalar bagi penguraian (k) bagi hampir semua komponen sisa bagi kedua-dua spesies adalah berbeza di antara setiap komponen. Separuh hayat ($T_{50\%}$) dan 95% jangka hayat ($T_{95\%}$) bagi komponen bukan daun seperti bunga, propagul, stipul dan ranting bagi kedua-dua spesies adalah berbeza sepenuhnya berbanding daun. Penguraian perlahan bagi komponen sisa yang maksima berhubungkait secara positif dengan kandungan lignin yang tinggi, menunjukkan pengaruh penting lignin terhadap kadar pereputan sisa. Turutan pelepasan sisa daripada berbagai komponen sisa dari spesies adalah daun > bunga > propagul > stipul > ranting.

Kadar tahunan pengumpulan mendapan pasang surut di paya bakau adalah 0.93 g/cm². Pengumpulan bulanan mendapan berhubungkait secara positif ($r=0.69$) dengan kadar hujan bulanan. Mendapan pasang surut secara relatif kaya dengan tekstur, bahan organik, organik karbon, keupayaan penukaran kation dan nutrien. Kandungan nutrien adalah tinggi pada mendapan pasang surut berbanding dengan permukaan (0-5 cm) dan kedalaman (30-50 cm) tanah di tempat kajian. Secara amnya, hubungkait positif yang signifikan adalah tinggi di antara mendapan nutrien dan kandungan nutrien dalam komponen (daun, stipul, bunga, propagul, batang, kulit kayu dan akar) pokok, pokok

muda dan anak pokok *R. apiculata* and *X. granatum* menunjukkan fungsi mendapan pasang surut dalam pengeluaran ekosistem paya bakau ini.

Nutrien pada permukaan tanah, terutamanya C, N, P, K, Na dan S berhubungkait secara positif dengan nutrisi pada kedalaman tanah. Nutrien dan liang air sungai (NH_4^+ , NO_3^- , PO_4^- , K, Ca, Mg and Na) hutan ini adalah tinggi pada musim kering dan NH_4^+ , Ca, Mg and Na pada liang air berhubungkait secara positif dengan nutrisi air sungai. Walaupun seluruh kandungan nutrisi adalah tinggi pada permukaan tanah, kebanyakan nutrisi terutamanya P, S, Mg dan Na pada tanah dalam berhubungkait secara positif dengan kandungan nutrisi pada komponen pokok bagi kedua spesies, mencadangkan pengambilan nutrisi tanaman adalah lebih pada kedalaman tanah melalui zon akar. Kadar C/N adalah berkaitan dengan tinggi nutrisi. Rendah kadar C/N didapati dalam semua komponen pokok *R. apiculata* (47-104), pokok muda (42-81) dan anak pokok (41-60) berbanding komponen pokok *X. granatum* (47-146), pokok muda (44-95) dan anak pokok (30-60). Ini menunjukkan penguasaan spesies *R. apiculata* yang memainkan peranan penting dalam dinamik nutrisi hutan paya bakau di Kuala Sibuti.

Paya bakau di kawasan muara Kuala Sibuti secara dasarnya adalah pelbagai dan kaya dari segi pengeluaran sepsis perikanan yang terdiri daripada 60 spesies daripada 32 famili. Di antara semua spesies *Coilia dussumieri* adalah paling dominan (22.63%) diikuti oleh *Nemapteryx caelata* (11.85%), *Otolithes ruber* (7.85%) dan *Ilisha elongata* (5.80%). Komposisi pelbagai spesies bagi sumber perikanan di muara ini kemungkinan disebabkan faktor hidro-biologi yang sesuai dan juga detritus dan nutrisi yang dibekalkan oleh hutan paya bakau. Penemuan kajian ini mengakui paya bakau Kuala Sibuti adalah ekosistem yang produktif. Spesies yang dominan *R. apiculata* memainkan peranan penting di sebalik produktiviti ini. Hasil daripada kajian ini akan berguna kepada para saintis bagi menjalankan kajian lanjutan dalam berbagai dimensi dan juga kesedaran tentang kepentingan hutan paya bakau asli.

ACKNOWLEDGEMENTS

All praise and admiration to the Almighty Allah (SWT), the most merciful and benevolent, who has given me the strength and ability to deal this challenge at this middle stage of life.

I would like to release my deep sense of gratitude to my supervisor Dr. Abu Hena Mustafa Kamal for his cordial assistance from the beginning and continuous guidance throughout the PhD endeavor. Special thanks are due to the committee members Dr. Mohd Hanafi Idris and Associate Prof. Dr. Osumanu Haruna Ahmed for their invaluable suggestions and professional guidance to accomplish this task.

I would also like to acknowledge the Dean, Associate Prof. Dr. Nur Ashikin Abdullah and all the faculty members of UPMKB for their cordial support and suggestions, whenever I needed. Special thank also goes to my friend Dr. A.T.M. Rafiqul Hoque, Post-Doctoral Fellow, JSHP and Dr. Tapan Kumar Nath, Associate Professor, Nottingham University, Malaysia for their cordial and critical suggestion related to my research.

My sincere appreciation goes to Dr. Huck, Latifah, Saifullah, Khursid, Ali, Kaleem, and Hasmidah for their cordial help, advice and suggestions. My heartfelt thanks and gratefulness to Md. Masum Billah, who really helped me during the analysis of data and interpretation. I am also thankful to lab assistants Ms. Elizabeth, Mr. Arni, Mr. Awang for their very cordial cooperation during lab works.

Field experiments and *in situ* data collection in the difficult working environment of pristine mangrove forest would not have been possible without the magnificent assistance of Mr. Rozi and his brother of Kuala Sibuti village.

It will be really ungratefulness, if I would not acknowledge our most respected Bhabi Mrs. Sadia Binte Hossain (wife of my supervisor) for her inherent role and encouragement during the course of study.

I am grateful to Ministry of Science, Technology and Innovation (MOSTI), Malaysia for providing necessary funding (E-Science; Project No. 04-01-04-SF1422) and also to UPM for providing Graduate Research Assistance (GRA) fellowship to make possible this study.

My father who was the main encourager to complete my PhD, and passed away in the middle of my study, is highly acknowledged. Finally, I would like to thank my mom, brothers, my wife, father/mother in laws, brother in law and his wife, for their love and encouragement which helped pursuing me passed through this long journey. I would also like to express my humbly apology to those persons, who helped me but could not remember to acknowledge in my narration here.

I certify that a thesis examination committee has met on 05/08/2015 to conduct the final examination of Mr. Mohammed Muzammel Hoque on his thesis titled 'Litterfall, Nutrients and Fishery Production in Kuala Sibuti Mangrove, Malaysia' in accordance with the Universities and University College act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 march 1998. The Committee recommends that the student be awarded the Doctor of Philosophy.

Members of the Thesis Examination Committee were as follows:

Hishamuddin Omar, PhD

Lecturer
Faculty of Sciences
Universiti Putra Malaysia
(Chairman)

Saberi Othman, PhD

Professor
Faculty of Science and Technology
Universiti Pendidikan Sultan Idris, Malaysia
(Internal Examiner)

Misri Kusnan, PhD

Lecturer
Faculty of Sciences
Universiti Putra Malaysia
(Internal Examiner)

K. Kathiresan, PhD

Professor and Dean
Faculty of Marine Sciences
Annamalai University, Tamil Nadu, India
(External Examiner)

ZULKARNAIN ZAINAL, PhD

Professor and Deputy Dean
School of Graduate Studies
Universiti Putra Malaysia

Date:

This thesis was submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfillment of the requirement for the Degree of Doctor of Philosophy. The members of the Supervisory Committee were as follows:

Abu Hena Mustafa Kamal, PhD

Senior Lecturer
Faculty of Agriculture and Food Sciences
Universiti Putra Malaysia Bintulu Sarawak Campus
(Chairman)

Mohd Hanafi Idris, PhD

Senior Lecturer

LIST OF TABLES

Table		Page
2.1	Rate of total litter production in different mangroves of the world	13
2.2	Comparison of leaf litter degradation rate with different mangrove species in different places	21
4.1	Seasonal ($\text{g/m}^2/\text{season} \pm \text{SE}$) and annual total litterfall production ($\text{g/m}^2/\text{yr} \pm \text{SE}$) of various components of dominant and co-dominant species of Kuala Sibuti mangrove during study period	55
4.2	Pearson correlation coefficient and significance level for various components of litters with climate variables of Kuala Sibuti mangrove, Sarawak	56
4.3	Seasonal ($\text{g/m}^2/\text{season} \pm \text{SE}$) and annual total standing crop litter production ($\text{g/m}^2/\text{yr} \pm \text{SE}$) of various components of dominant and co-dominant species of Kuala Sibuti mangrove, Sarawak	58
4.4	Mean value of fresh weight, oven dry weight and conversion factor with standard error of <i>R. apiculata</i> and <i>X. granatum</i> leaf litter degradation during the dry and wet months sampling period	59
4.5	Decomposition constant (k), half-life ($T_{50\%}$) and 95% lifespan ($T_{95\%}$) of <i>R. apiculata</i> and <i>X. granatum</i> litter components remaining in degradation period of litters during the dry and wet months (Calculation of k , $T_{50\%}$ and $T_{95\%}$ for day 30 of collection during the dry months and day 25 of collection during the wet months)	62

4.6	Decomposition constant (k) of <i>R. apiculata</i> and <i>X. granatum</i> litter components dry mass remaining in different collection time interval during the dry and wet months	63
4.7	Contribution of macro-feeders and micro-organisms to <i>R. apiculata</i> and <i>X. granatum</i> leaf litter degradation	66
4.8	Average (%) of Acid-insoluble Lignin (AIL) contents in different degraded litter components of <i>R. apiculata</i> and <i>X. granatum</i> during the dry and wet months	67
4.9	Average (%) of Acid Soluble Lignin (ASL) contents in different degraded litter components of <i>R. apiculata</i> and <i>X. granatum</i> during the dry and wet months	67
4.10	Range and average (%) of nutrient release during the decomposition of different <i>R. apiculata</i> and <i>X. granatum</i> litter components in the dry months	69
4.11	Range and average (%) of nutrient release during the decomposition of different <i>R. apiculata</i> and <i>X. granatum</i> litter components in the wet months	70
4.12	Linear regression of N, P, K, Acid-insoluble Lignin (AIL) and C/N ratio against month wise decomposition rate (%) of different litter components of <i>R. apiculata</i> and <i>X. granatum</i> during the dry and wet months	88
4.13	Comparison of litterfall production estimates of <i>R. apiculata</i> from mangroves in the regional and other tropical coasts	90
4.14	Comparison of decay constants (k), half-life ($T_{50\%}$) and 95% lifespan ($T_{95\%}$) of litter components of various mangrove species	96

5.1	Climatic and tidal factors of Kuala Sibuti mangrove during the study period (January-December, 2013)	107
5.2	Pearson correlation coefficient among sediment accumulation with climatic and hydro-parameters of Kuala Sibuti mangrove, Sarawak	109
5.3	Seasonal pattern of tidal borne sediment texture and cation exchange capacity (CEC) of Kuala Sibuti mangrove	109
5.4	Mean (\pm SE) and monthly trend of different nutrient contents in the tidal borne sediments during the study period	112
5.5	Correlation matrix showing the coefficient of correlation (r) among the different nutrient concentration of sediments during the study period	113
5.6	Pearson correlation coefficient (r) between tidal borne sediment nutrient and nutrient content in different components of <i>R. apiculata</i> trees, sapling and seedlings	115
5.7	Pearson correlation coefficient (r) between tidal borne sediment nutrient and nutrient content in different components of <i>X. granatum</i> trees, sapling and seedlings	116
5.8	Loadings of nutrient contents (8 variables) of tidal born sediments on the first three rotated principle component for complete data set (bold numbers represents moderate and strong loadings)	119

6.1	Seasonal pattern (Intermediate: March, Dry: July and Wet: November) of some essential soil parameters of Kuala Sibuti mangrove, Sarawak	130
6.2	Mean (\pm SE) and seasonal pattern of different nutrients contents in surface (0-5 cm) and deeper (30-50 cm) soil of Kuala Sibuti mangrove during the study period	133
6.3	Pearson correlation coefficient (r) between soil nutrient of the surface (0-5 cm) and deeper (30-50 cm) soil and nutrient content in different components of <i>R. apiculata</i> trees	135
6.4	Pearson correlation coefficient (r) between soil nutrient of the surface (0-5 cm) and deeper (30-50 cm) soil and nutrient content in different components of <i>R. apiculata</i> sapling and seedlings	136
6.5	Pearson correlation coefficient (r) between soil nutrient of the surface (0-5 cm) and deeper (30-50 cm) soil and nutrient content in different components of <i>X. granatum</i> trees	137
6.6	Pearson correlation coefficient (r) between soil nutrient of the surface (0-5 cm) and deeper (30-50 cm) soil and nutrient content in different components of <i>X. granatum</i> sapling and seedlings	138
6.7	Seasonal pattern of some essential water parameters. Means with similar alphabet within same column are not significantly different	141
6.8	Seasonal pattern of nutrient contents (mg/L) in pore and river water during the study period	142

- 6.9 Mean (\pm SE) and seasonal pattern of different nutrients contents in plant components (tree parts) of *R. apiculata* during the study period 145
- 6.10 Mean (\pm SE) and seasonal pattern of different nutrients contents in plant components (sapling parts) of *R. apiculata* during the study period 148
- 6.11 Mean (\pm SE) and seasonal pattern of different nutrients contents in plant components (seedling parts) of *R. apiculata* during the study period 150
- 6.12 Mean (\pm SE) and seasonal pattern of different nutrients contents in different litterfall components of *R. apiculata* during the study period 151
- 6.13 Mean (\pm SE) and seasonal pattern of different nutrients contents in different litter standing crop components of *R. apiculata* during the study period 152
- 6.14 Mean with standard error and seasonal pattern of different nutrients contents in plant components (tree parts) of *X. granatum* during the study period 155
- 6.15 Mean (\pm SE) and seasonal pattern of different nutrients contents in plant components (sapling parts) of *X. granatum* during the study period 156
- 6.16 Mean with standard error and seasonal pattern of different nutrients contents in plant components (seedling parts) of *X. granatum* during the study period 157
- 6.17 Mean (\pm SE) and seasonal pattern of different nutrients contents in different litterfall components of *X. granatum* during the study period 158

6.18	Mean (\pm SE) and seasonal pattern of different nutrients contents in different litter standing crop components of <i>X. granatum</i> during the study period	159
6.19	Comparison of some essential soil parameters in different mangrove forest	176
6.20	Comparison of some essential soil nutrients in different mangrove forest	178
6.21	Comparison of some essential nutrients in different components of mangrove plants in different mangrove forests	184
7.1	Mean values of different hydro-biological factors recorded in different seasons during the study period	191
7.2	Relationship within different hydro-biological factors at different significant level of Kuala Sibuti mangrove river estuary, Sarawak	193
7.3	Species composition and their individual contribution in different seasons recorded in Kuala Sibuti mangrove river estuary	195
7.4	Seasonal pattern of fishery production in Kuala Sibuti mangrove river estuary	197
7.5	Seasonal succession of different species/taxa recorded during the study period in Kuala Sibuti mangrove river estuary	199
7.6	Results of ANOSIM and SIMPER showing the global R, significance level (P), average dissimilarity between seasons as well as contribution of major discriminating species among	200

various seasons

LIST OF FIGURES

Figure		Page
2.1	Ecological and Economic Significance of Mangroves (Adapted from Berjak <i>et al.</i> , 1977)	8
2.2	Flow Chart Showing Salient Findings (*Indicates the Measure not Studied; Adapted from Kathiresan, 2003)	24
3.1	Location of the Study Area Showing Sampling Plots in Kuala Sibuti Mangrove Forest, Miri, Sarawak	37
3.2	Showing Structure of Kuala Sibuti mangrove forest (A: <i>Nypa fruticans</i> ; B&G: <i>Rhizophora apiculata</i> , C: <i>Intsia bijuga</i> ; D: <i>Xylocarpus mekongensis</i> ; E: <i>Xylocarpus granatum</i> ; F: <i>Excoecaria agallocha</i> ; H: <i>Thespesia populnea</i> ; I: <i>Phoenix paludosa</i> ; J: <i>Acrostichum speciosum</i>)	38
3.3	Total Monthly Rainfall, Monthly Mean Maximum, Mean Monthly and Minimum Mean Temperature (°C) of Kuala Sibuti Mangrove Forest from January to December 2013	39
4.1	Month Wise Average Litterfall Production of Different Components of (a) <i>R. apiculata</i> and (b) <i>X. granatum</i> in Kuala Sibuti Mangrove Forest	53
4.2	Relation with Monthly Total Litter Productivity of <i>R. apiculata</i> and <i>X. granatum</i> with Monthly Rainfall of Kuala Sibuti Mangrove Forest	54

4.3	Box and Whisker Plots of Different Litterfall Components Recorded in Each Month throughout the Research Period for <i>R. apiculata</i> and <i>X. granatum</i> in Kuala Sibuti Mangrove, Sarawak. The Plots Include Minimum, 25 th Percentile, Median (marked with a dash), 75 th Percentile, and Outlier of the Data. The Outliers are Shown as * and 0. (Legend: Ra= <i>R. apiculata</i> ; Xg= <i>X. granatum</i> ; Lf=Leaf; Fl=Flower; Pr=Propagule; Tg=Twigs)	55
4.4	Monthly Total Litter Standing Crop (g/m ² /month) in Relation to Month Wise no of High Tide and Tidal Duration Flooded Kuala Sibuti Mangrove during the Study Period	57
4.5	Inter-relation between Monthly Total Litter Standing Crop (g/m ² /month) with the Month Wise Number of High Tide that Flooded the Forest Floor during the Study Period	57
4.6	Pattern of % Dry Mass Remaining of Different Litter Components of <i>R.apiculata</i> and <i>X. granatum</i> during Different Time Interval in the Dry Months (N.B: Ra= <i>R. apiculata</i> , Xg= <i>X. granatum</i> , lf=leaf, pg=propagule, tg=twigs, a=Ra and Xg leaf, b=Ra and Xg propagule, c= Ra and Xg twigs and d= Ra stipule and flower dry mass remain)	60
4.7	Pattern of % Dry Mass Remaining of Different Litter Components of <i>R.apiculata</i> and <i>X. granatum</i> during Different Time Intervals in the Wet Months (N.B: Ra= <i>R. apiculata</i> , Xg= <i>X. granatum</i> , lf=leaf, pg=propagule, tg=twigs, a=Ra and Xg leaf, b=Ra and Xg propagule, c= Ra and Xg twigs and d= Ra stipule and flower dry mass remaining)	61
4.8	Mean (%) of Degradation Rate of Leaf Litter on String of <i>R. apiculata</i> and <i>X. granatum</i> at Different Time Interval during the Dry Months	64

4.9	Mean (%) of Degradation Rate of Leaf Litter of <i>R. apiculata</i> and <i>X. granatum</i> in Strings at Different Time Interval during the Wet Months	65
4.10	Carbon Contents (%) of Different Litter Components of <i>R. apiculata</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months	68
4.11	Carbon Contents (%) of Different Litter Components of <i>X. granatum</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months	71
4.12	Organic Matter Contents (%) of Different Litter Components of <i>R. apiculata</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months	72
4.13	Organic Matter Contents (%) of Different Litter Components of <i>X. granatum</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months	73
4.14	Nitrogen Contents (mg/g) of Different Litter Components of <i>R. apiculata</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months	74
4.15	Nitrogen Contents (mg/g) of Different Litter Components of <i>X. granatum</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months	75
4.16	Sulphur Contents (mg/g) of Different Litter Components of <i>R. apiculata</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months	76

4.17	Sulphur Contents (mg/g) of Different Litter Components of <i>X. granatum</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months	77
4.18	Phosphorus Contents (mg/g) of Different Litter Components of <i>R. apiculata</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months	78
4.19	Phosphorus Contents (mg/g) of Different Litter Components of <i>X. granatum</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months	79
4.20	Potassium Contents (mg/g) of Different Litter Components of <i>R. apiculata</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months	80
4.21	Potassium Contents (mg/g) of Different Litter Components of <i>X. granatum</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months	81
4.22	Calcium Contents (mg/g) of Different Litter Components of <i>R. apiculata</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months	82
4.23	Calcium Contents (mg/g) of Different Litter Components of <i>X. granatum</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months.	83
4.24	Magnesium Contents (mg/g) of Different Litter Components of <i>R. apiculata</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months	84

4.25	Magnesium Contents (mg/g) in Litter Components of <i>X. granatum</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) months	85
4.26	Sodium Contents (mg/g) of Different Litter Components of <i>R. apiculata</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months	86
4.27	Sodium Contents (mg/g) of Different Litter Components of <i>X. granatum</i> at Different Stages of Degradation in Litter Bags during the Dry (a) and Wet (b) Months	87
5.1	Relation between Monthly Sediment Accumulation and Rainfall in Kuala Sibuti Mangrove, Sarawak	108
5.2	Seasonal Patterns of Total Carbon, Organic Matter and Organic Carbon (%) Contents of Tidal Borne Sediments in Kuala Sibuti Mangrove, Sarawak. The Same Letter indicates no Significant Differences among Different Seasons (Tukey, $p>05$)	110
5.3	Box and Whisker Plots Showing Distribution of Elemental Concentrations in Tidal Borne Sediments of Kuala Sibuti Mangrove. Circles (o) and Stars (*) Represent the Outliers of the Distribution	111
5.4	Seasonal Patterns of Total Nitrogen, Sulphur and Phosphorus Contents (mg/g) of Tidal Borne Sediments in Kuala Sibuti Mangrove, Sarawak. The Same Letter indicates no Significant Differences among Different Seasons (Tukey, $p>05$)	113
5.5	Similarities of Different Nutrient Concentrations of Tidal Borne Sediments in Kuala Sibuti Mangrove.	114

5.6	Seasonal Patterns of Total Potassium, Calcium, Magnesium and Sodium Contents (mg/g) of Tidal Borne Sediments of Kuala Sibuti Mangrove, Sarawak. The Same Letter indicates no Significant Differences among Different Seasons (Tukey, $p>05$)	117
5.7	Principal Components Analysis (PCA) Ordination of Sediment Nutrient Characteristics of Samples Collected in Different Seasons from Kuala Sibuti Mangrove Forest	119
6.1	Box and Whisker Plots Showing Distribution of Elemental Concentrations in the Surface Soil of Kuala Sibuti Mangrove. Circles (o) and Stars (*) Represent the Outliers of the Distribution	131
6.2	Box and Whisker Plots Showing Distribution of Elemental Concentrations in the Deeper Soil of Kuala Sibuti Mangrove. Circles (o) and Stars (*) Represent the Outliers of the Distribution	132
6.3	Similarities of Different Nutrient Concentrations of Surface Soil in Kuala Sibuti Mangrove	132
6.4	Similarities of Different Nutrient Concentrations of Deeper Soil in Kuala Sibuti Mangrove	132
6.5	Similarities of Carbon and Nitrogen Contents among the Different Components of <i>R. apiculata</i> and <i>X. granatum</i> (L=Leaf, F=Flower, P=Propagule, St=Stipule, S=Stem, B=Bark, R=Root, T=Twig)	154
6.6	Similarities of Sulphur and Phosphorus Contents among the Different Components of <i>R. apiculata</i> and <i>X. granatum</i> (L=Leaf, F=Flower, P=Propagule, St=Stipule, S=Stem, B=Bark, R=Root, T=Twig)	164
6.7	Similarities of Potassium and Calcium Contents among the Different Components of <i>R. apiculata</i> and <i>X. granatum</i> (L=Leaf, F=Flower, P=Propagule, St=Stipule, S=Stem, B=Bark, R=Root,	169

T=Twig)

- 6.8 Similarities of Magnesium and Sodium Contents among the Different Components of *R. apiculata* and *X. granatum* (L=Leaf, F=Flower, P=Propagule, St=Stipule, S=Stem, B=Bark, R=Root, T=Twig) 173
- 7.1 Seasonal Variations of Diversity Indices (mean±SD): Shannon-Wiener Diversity Index (H'), Margalef Richness (D) and Species Evenness (J) of Fisheries Abundance in Kuala Sibuti Mangrove River Estuary. Same Alphabet Indicates no Significant Differences of Diversity Indices (H' , D, J) among Different Seasons (Tukey, $P > 0.05$) 198
- 7.2 Dendrogram Showing Three Distinct (dry, intermediate, wet and intermediate) Cluster of Catch Composition from Bray-Curtis Similarity Matrix in Kuala Sibuti Mangrove River Estuary (I1-I4; D1-D4; W1-W4 were the Catch Composition of Fisheries Assemblages at Different Time Intervals during Intermediate=I, Dry=D and Wet=W seasons) 201
- 7.3 Non-metric Multidimensional Scaling (nMDS) Showing the Seasonal Catch Composition of Species Assemblage (2D stress=0.009) in Kuala Sibuti Mangrove River Estuary 201
- 7.4 Canonical Correspondence Analysis (CCA) of Fisheries Assemblages in Relation to Hydro-biological Factors in Kuala Sibuti Mangrove River Estuary (Code elaboration of each species is given in Table 7.3) 202
- 8.1 Ecological Roles of Kuala Sibuti Mangrove Forest (? Indicates Future Research Direction) 209

CHAPTER 1

GENERAL INTRODUCTION

1.1 Background

Mangroves are the only woody halophytes and unique ecosystems that are generally found between the confluence of land and sea, especially in the tropical and sub-tropical regions (Kathiresan and Bingham, 2001; Alongi, 2002; Polidoro *et al.*, 2010). They grow in such environment where other species generally do not grow and they have the tolerance capacity to cope with the harsh environments with high temperature, extreme tide, high salinity, strong winds, muddy and anaerobic soils (Kathiresan and Bingham, 2001). To survive in such harsh and extreme environments, they are enriched with special morphological and physiological adaptation characters such as aerial (prop, knee and plank) roots, pneumatophores, viviparous embryos, water-dispersed propagules, highly nutrient retention mechanism which are generally very rare in other plants (Kathiresan and Bingham, 2001; Saint-Paul and Schneider, 2010; Krauss *et al.*, 2014).

Mangrove forests are considered as one of the most productive ecosystems in the tropic and have multiple roles and functions (Karami *et al.*, 2009). They have various functions such as ecological, environmental, socioeconomic and physical which contribute to the stability of biodiversity, coastlines and communities live in the surrounding (Rambok *et al.*, 2010; Saint-Paul and Schneider, 2010; Kathiresan, 2012). They protect and stabilize coastlines, and serve as natural barriers against strong winds including floods, sea level rise, coastal erosion, cyclone and tsunamis (Kathiresan, 2012; Krauss *et al.*, 2014). They also play key roles for trapping of sediments and recycling of nutrients within and nearby aquatic ecosystem (Alongi, 2002; Kathiresan, 2012). Mangroves are the essential source of forest and non-timber forest products (NTFP) such as timber, charcoal, fuel wood, honey, wax, fodder, pulp, thatching materials and medicine (Field, 1995; Kathiresan, 2012). They also serve as nursery and breeding ground for commercial and artisanal fishery resources (Kathiresan and Bingham, 2001; Franco-Gordo *et al.*, 2003; Akin *et al.*, 2003; Huxham *et al.*, 2004). Mangroves export detritus and nutrients into nearby systems that form the food base of numerous marine organisms which in turn support valuable near shore fishery resources (Sasekumar *et al.*, 1992). It has been found that, around 80% of global fish are directly or indirectly reliant on mangroves (Sullivan, 2005; Ellison, 2008). They have the buffering capacity to stop storms, flooding, and provide enormous benefits and values to human beings and other marine organisms (Garcia *et al.*, 2014). Moreover, mangroves are the potential sources of carbon (Golubic, 1973; Potts, 1979; Grimsditch, 2011), aquaculture and place for eco-tourism (Kathiresan and Bingham, 2001). The value of mangrove forest in regards to biomass production is also high as compared to other plant community (Rodriguez and Feller, 2004). The economic valuation of mangroves forests is estimated from 200,000 to 900,000 US\$ km²/year (UNEP-WCMC, 2006). The productivity of mangroves is 25 folds higher compared to paddy cultivation (Kathiresan, 2012).

There are about 15.2 million hectares of mangrove forests around the world (FAO, 2007). These forests are distributed in almost 124 countries, covering an area of about 1% of the world (Saenger, 2002). Out of total mangroves forests, 37% are in Asia,

27.2% in North, Central and South America, 21% in Africa and 12% in Australia, New Zealand, South Pacific Islands and Papua New Guinea (FAO, 2007; Sandilyan and Kathiresan, 2012). Around 60% of the world mangroves belong to ten countries including Malaysia (FAO, 2007). Malaysia contributes about 4% of the world mangroves and placed at the 6th position in terms of area coverage (FAO, 2007). There are about 577, 500 ha of mangrove forests in Malaysia (Jusoff, 2013), which cover less than 2% of the total land area of the country (Shukor, 2004). The mangroves of Malaysia are under the jurisdiction of different states forest department and the major portions of mangroves are in Sabah (59%), Sarawak (23%) and Peninsular Malaysia (17%) (Jusoff, 2013). These mangroves are mostly distributed along the west coast of Peninsular Malaysia, at the estuaries of Sarawak, Rejang delta, Trusan-Lawas and along the east coast of Sabah (Chan, 1987; Latif and Faidah-Hanum, 2014).

Out of numerous attributes of mangroves ecological productivity, some of the most important attributes are litterfall and nutrients release through decomposition, nutritive roles of tidal borne sediments, nutrients inputs from different sources, nursery and breeding ground for fishery resources are remarkable. Litterfall is the function and indicator of primary productivity and important for within stand nutrient cycling, and exports of nutrients and organic detritus to the adjacent estuarine ecosystem (Gong and Ong, 1990; Ashton *et al.*, 1999). It has significant importance on the detritus based food webs in the coastal environment as well as coastal fisheries (Odum and Heald, 1975; Lee, 1995). However, the amount of nutrients and organic matter that transport from the mangroves to adjoining aquatic ecosystem are associated with the rate of litter decomposition (Valiela *et al.*, 1985; Twilley *et al.*, 1986; Roberston, 1988; Chale, 1993; Kathiresan, 2012). Apart from this, nutrient cycling within mangrove ecosystem (Lu and Lin, 1990; Steinke *et al.*, 1993), mangroves tree productivity and adjoining food chain (Ashton *et al.*, 1999) are completely depends on the rate of nutrients and organic matter release during the process of decomposition. Therefore, decomposition process studies are necessary to estimate the contribution of mangroves in regards to nutrient recycling within as well as adjoining estuarine ecosystems.

Mangroves are frequently inundated by tidal action, while numerous materials are exchanged within mangroves and adjacent aquatic ecosystems (Ye *et al.*, 2011). Mangroves forest floor are generally flooded by tidal water during high tide and these tidal water carry enormous sediments and nutrients to the mangroves in the form of dissolved and particulate matter. These tidal sediments are rich in nutrients and play significant roles in the productivity and nutrient dynamics of mangrove ecosystem (Mackey and Hodgkinson, 1995).

Nutrients in plants are interlinked with the soil and water characteristics which control the growth, composition and distribution of species (Alongi *et al.*, 1993; Ukpong, 1994). Optimum amounts of nutrient availability are the most important factors that have noteworthy roles in regards to forest structure and productivity of mangroves (Reef *et al.*, 2010). Plants uptake available form of nutrients from the soil and then translocate to different components. These nutrients are essential for different physiological function, normal growth and metabolism of plants or to complete life cycle (Jones *et al.*, 1991; Marschner, 1995). Therefore, it is important to measure, compare and find out the relationship of soil, water parameters and nutrients in regards to forest health, productivity and nutrient dynamics of a particular mangrove ecosystem.

Besides, mangrove dominated estuary is a highly productive ecosystem as a nursery, breeding and feeding ground for fishery resources (Akin *et al.*, 2003; Huxham *et al.*, 2004). Most of the estuarine fishery resources are directly or indirectly dependent on the detritus and nutrients which are derived from the mangroves. Therefore, litterfall and nutrients release through decomposition, tidal sediment nutrients, nutrients of soil, water and plants are interlinked in a dynamic mangrove ecosystem and have significant roles and influence on the diversity and productivity of estuarine fishery resources.

1.2 Research Problem

In spite of versatile roles and functions, globally mangroves are under heavy pressure. Despite the increasing recognition of the need to conserve mangroves, losses are continuing. Around 35% of the world mangroves were lost in last two decades mainly in 1980s and 1990s, of which 26% losses were due to firewood and timber production (Valiela *et al.*, 2001). Moreover, worldwide, 38% of mangroves were lost due to the conversion of mangroves to shrimp culture along with other aquaculture activities that account for another 14% mangroves loss (Ellison, 2008). Currently, mangroves are disappearing at the rate of 1% per year worldwide (FAO, 2003; 2007); however, in another study it is estimated from 2-8% per year (Miththapala, 2008). As a result of human pressure and activities, many mangrove species are at the verge of extinction (Polidoro *et al.*, 2010). In recent years, the human impact on mangroves has increased and 50-80% forests cover have been disappeared in many countries over the last 50 years (Macintosh *et al.*, 2011). The present trend of mangroves deterioration is expected to continue or accelerate unless proper conservation efforts are undertaken considering the mangroves as valuable resource (Alongi, 2002). Moreover, mangroves might functionally disappear within 100 years, if the present trends continue (Duke *et al.*, 2007). The increasing threats and human pressure on the mangrove resources make the situation complex; hence more research works are essential emphasizing the ecological significance and attributes of mangroves as a baseline and valuable information of an ecosystem.

Likewise other countries, the loss of mangroves in Malaysia are also not different especially from 1973 to 2000, while around 111,046 ha of mangroves had been disappeared and found to be a bit higher considering the average global loss of mangroves (Chong and Sasekumar, 2002). At that period, although the overall loss is about 16%, some of the states (Johor, Selangor, Negeri Sembilan and Terengganu) lost around 30-70% of their total mangroves areas (Chan *et al.*, 1993; Alongi, 2002). The destruction of mangroves in Malaysia is mainly due to the construction of sea ports, airport, industrial estate as well as conversion to aquaculture and agricultural land (Ong, 1982). For converting mangroves forests into other land uses such as for aquaculture, housing estate, planting rice, palm oil and other development projects, Sarawak had lost around 24% of its pristine mangroves over the past 30 years (Anon, 2008). The conversion of peat swamp forests to other land uses affect the peat and impair its functions (Peter, 2003; Firdaus *et al.*, 2010). The losses of mangroves result in serious ecological, environmental and economic constraints in the coastal regions of some states. These losses lead to long term impacts on fishery resources, loss of detritus, flora and fauna and even in the acceleration of coastal erosion (Saenger *et al.*, 1983; FAO, 1994). Because of the aforementioned losses, it is assumed that the losses may impart negative effect on the ecological process of mangroves ecosystem that may effect on the coastal productivity. Litter exchange and biogeochemistry of mangroves

may also be hampered along with the nutrient exchange from the mangrove forests to nearby coastal ecosystems (Twilley and Chen, 1997).

Despite of versatile function, exceptional and unique characteristics and variations of these functions and characteristics in regards to geographical location and changing environment, knowledge on the ecological processes of mangroves are still inadequate worldwide (UNEP-WCMC, 2006). Moreover, in spite of versatile importance of mangroves in regards to ecological services, very scarce information are available in Malaysia, especially in Sarawak, where pristine and undisturbed mangroves are found along the coastlines (Kasawani *et al.*, 2007; Latif and Faidah-Hanum, 2014; Wan Juliana *et al.*, 2014). But no studies have yet been conducted on the ecological roles especially on primary productivity, sedimentation, nutrient dynamics and mangroves-fishery linkages of an undisturbed and matured forest of Sarawak, Malaysia. This leads to incomplete understanding of mangrove function in Sarawak, Malaysia.

Worldwide researches on mangroves are diverse (Krauss *et al.*, 2014). For example, some of the researches are conducted on different aspects of mangroves such as soil and water physiological characteristics (Tam *et al.*, 1995; Ashton and Macintosh, 2002), standing biomass (Komiyama *et al.*, 2000), productivity (Day *et al.*, 1996; Ye *et al.*, 2011), litter production (Sharma *et al.*, 2012; Ye *et al.*, 2013; Abu Hena *et al.*, 2015), litter decomposition (Hossain and Othman, 2005; Imgraben and Dittmann, 2008; Dewiyanti, 2010; Oliveira *et al.*, 2013), nutrient dynamics (Sanchez-Andres *et al.*, 2010; Hossain *et al.*, 2014). Interestingly, almost all of the litter decomposition study of mangroves conducted worldwide was on leaf litter decomposition. Though leaf is the major components of litters and most of the cases it is around 40-70%, it does not cover the rate of total litter decomposition in a mangrove ecosystem. Because non-leafy components such as flowers, propagules, stipules and twigs are also part of litters and might have significant roles in the long term productivity and nutrient dynamics of mangrove ecosystems. Moreover, tidal borne sediments are an important source of nutrients to the mangrove ecosystem (Boto, 1982; Aksornkoae, 1993). However, almost all the studies related to sediments are on geochemistry, trace metals and pollution control, and research on productive roles of tidal borne sediments are less. On the other hand, considering the major ecological processes of an undisturbed mangrove is also found very few to understand the overall function of pristine mangroves.

Considering the global scenario, the progress of research, especially for some of the important states of Malaysia is also not adequate. Most of the researches in Malaysia are on the mangroves of Peninsular Malaysia, although Sarawak and Sabah are enriched with numerous pristine Mangroves (Saifullah *et al.*, 2014). The researches are mostly on sustainably managed Matang mangroves such as standing biomass, productivity and litter dynamics (Gong *et al.*, 1984, Ong *et al.*, 1985; Putz and Chan, 1986), nutrient flux (Gong and Ong, 1990), litter decomposition (Japar Sidik, 1989, Hossain, 2004). Some partial researches were also conducted on the ecological processes of Sarawak mangroves such as carbon sequestration (Arianto, 2014), water characteristics (Rosli *et al.*, 2010; Saifullah *et al.*, 2014), Soil properties (Rambok *et al.*, 2010), heavy metals in mangrove sediments (Billah *et al.*, 2014), litterfall (Othman, 1989), species diversity and composition (Ashton and Macintosh, 2002; Kaleem *et al.*, 2015). Therefore, research on ecological roles and productivity of Sarawak mangroves is few; however, for effective management, an understanding of ecological process is essential (Ashton and Macintosh, 2002; Latif, 2012; Latif and Faridah-Hanum, 2014).

1.3 Significance of the Study

Globally, the overall services of mangroves are well documented and these services vary due to geographical location, species composition, density, age of stand, climatic and edaphic factors, and also due to whether it is planted, undisturbed or pristine in nature (Duke *et al.*, 1998; Alongi, 2002). Therefore, it is essential to determine the regional status or site specific services of mangroves to quantify and evaluate its status for the sustainable conservation and management in future. Although, economic and environmental services of mangroves are prioritized than that of ecological services, ecological services have numerous direct and indirect benefits. Besides, economic and environmental services are inter-linked with the ecological services of an ecosystem. Therefore, for a systematic study, at first, it is pre-requisite to determine the ecological services of an ecosystem that will be helpful to evaluate the economic and environmental services of that ecosystem, considering the ecological services as baseline and valuable information (Ashton and Macintosh, 2002). On the other hand, the productivity of mangrove forests depend on overall functions as well as inter-relations among the various components of ecological processes such as productivity of plant materials, soil-water and plants inter-relation, productive and nutritive roles of sediments, nutrient dynamics within and nearby aquatic ecosystems, production of fishery resources which are dependent on the mangrove based food detritus.

Kuala Sibuti mangrove, the study area is an undisturbed mangrove forest of Sarawak (Saifullah *et al.*, 2014) dominated by *Rhizophora apiculata* (Gandaseca *et al.*, 2011; Kaleem *et al.*, 2015). Being an undisturbed and matured forest, it was hypothesized that the ecological roles of this forest could be different which need to be explored.

Therefore, considering the aforementioned research works, global and regional significance and recommendations of the various researchers, the most important ecological and productive roles of mangroves such as litterfall and nutrients release through decomposition, sediment productivity, nutrient inputs from different sources, fisheries diversity and production were emphasized for the purpose of the present study. Hence, the findings of this study would be helpful for the scientists especially ecologists, planners, decision makers, conservationists and the development practitioners to conduct further in depth research in other various dimensions as well as to formulate an effective conservation management plan (CMP) considering the ecological significance of the area.

1.4 Objectives of the Study

Considering the stated research problems, the overall goal of the present study was to explore the productive ecological roles of an undisturbed mangrove forest of Sarawak, Malaysia.

The specific objectives were:

1. To quantify the litterfall production and nutrients release through decomposition in Kuala Sibuti mangrove forest;
2. To determine the nutrition of tidal borne sediments in the study area;

3. To observe the seasonal pattern and productivity of nutrients in the study area; and
4. To assess the diversity and productivity of fishery resources in Kuala Sibuti mangrove estuary.
