ABSTRACT

Purines are natural substances found in body's cells and in virtually all foods. When purine derivatives undergo metabolic breakdown, uric acid is produced. Abnormally high concentration of uric acid in the body can lead to diseases such as gout and uric acid stone formation. Thus, uric acid determination serves as a marker and plays a very important role in diagnosis. For clinical diagnosis and monitoring purposes, biosensor has been introduced as it is a fast and reliable analytical device. Demands for the current trend of biosensor development keep on increasing due to the advancement in technology especially the applications of biosensors using optical detection. In the present study, uricase from *Arthrobacter globiformis* was used as a bio-receptor and integrated to optical fibre for uric acid determination. Preliminary experiments of uricase immobilization techniques on glass slide were conducted before proceeding on optic fibre. Glass activation produces more reactive hydroxyl groups on the glass surface and utilization of both chitosan and glutaraldehyde as cross-linker demonstrated a better response towards uric acid. The immobilization techniques and optimum enzyme concentration obtained were then employed and proceeded on a tapered optical fibre. Uricase-immobilized tapered optic fibre with waist diameter of 80 μm and waist length of 20 mm was shown to have a positive relationship between absorbance value and concentration of uric acid range from 1.0 mM to 2.0 mM. From the results obtained, optical sensing of uric acid was possible and successful by using uricase as bio-receptor.

ABSTRAK

Asid urik terbentuk daripada pemecahan purin yang terdapat dalam kebanyakan tisu manusia dan makanan. Paras asid urik yang luar biasa tingginya dalam badan boleh menyebabkan penyakit seperti gout dan penjadian/pembentukan batu karang. Oleh sebab itu, pengesanan paras asid urik adalah sangat penting sebagai penanda terutamanya dalam sektor perubatan. Untuk tujuan ini, biosensor telah diperkenalkan sebagai alat pengesanan kerana penggunaannya adalah sangat cepat dan tepat. Permintaan terhadap penciptaan biosensor kian tinggi di pasaran disebabkan oleh kemajuan teknologi yang canggih terutamanya pengesanan optik. Dalam kajian ini, uricase dari *Arthrobacter globiformis* dipilih sebagai bio-reseptor dan diintegrasikan dengan gentian optik untuk mengesan paras asid urik. Eksperimen awal melibatkan teknik immobilisasi enzim di atas kaca slaid telah dijalankan. Pengaktifan kaca untuk menghasilkan kumpulan hidroksil yang aktif atas permukaan dan penggunaan chitosan dan glutaraldehyde sebagai paut silang menunjukkan respond yang lebih baik terhadap asid urik. Teknik immobilisasi dan kepekatan enzim optimum yang diperolehi telah digunakan dan dialihkan ke atas gentian optik. Urikase terimmobilisasi pada gentian optik dengan diameter 80 μ m dan panjang 20mm telah terbukti mempunyai hubungan positif antara nilai keserapan dan kepekatan asid urik dari kadar 1mM ke 2mM. Berdasarkan keputusan yang diperolehi, pengesanan optik asid urik adalah tidak mustahil dan berjaya dicapai dengan menggunakan urikase sebagai bio-reseptor.

ACKNOWLEDGEMENT

First and foremost, I would like to extend my deepest gratitude to my supervisor, Prof. Dato' Dr. Abu Bakar Salleh for his valuable guidance and advice. His patience, encouragement and understanding helped me in all time of research and writing of this thesis. I would also like to extend my appreciation to Dr. Amir for his comments and kindness during my research.

Furthermore, I would like to thank all the seniors and members of Enzyme & Microbial Technology Research Centre, EMTech (140 and 209) especially Arilla, Zarir and Hamza for the assistance, support and sharing of experience and knowledge throughout the study. My warmest gratitude also goes to Akmar and Yasmin from engineering laboratory.

Last but not least, I would like to thank my family members especially my parents and friends especially Elisa, Emay, Haeida, Kai Lee, Mun Hong, Wyatt and Weini for their loving support, companion and encouragement throughout this period. This research project would not be possible without helps of the particular that mentioned above. Thank you very much!

CHAPTER 1

INTRODUCTION

Purines which consist of a pyrimidine ring fused to an imidazole ring are natural substances found in body's cells and in virtually all foods. When purine derivatives undergo metabolic breakdown, uric acid (2,6,8-trihydroxypurine) is produced (Schrenkhammer & Wolfbeis, 2008). Detection and quantification of uric acid plays a very important role as abnormally high concentrations of uric acid (hyperuricemia) are linked to diseases such as gout, cardiovascular disease, hypertension and arthritis (Devi & Pundir, 2014). Hence, uric acid determination serves as a marker and is important in diagnosis and for monitoring a large number of diseases (Misra *et al.*, 2013).

Several different methods of uric acid detection are available. The most common one is based on the use of the enzyme uricase. Uricase, also known as urate oxidase, is absent in humans and catalyses the oxidation of uric acid to produce hydrogen peroxide, allantoin and carbon dioxide (Zhao *et al.*, 2008).

Biosensor is an analytical device that consists of a bio-receptor and a transducer. Uricase is selected as a bio-receptor because enzymes are well-known as a biological sensing materials due to their specificity and bio-recognition capability (Malhotra & Chaubey, 2003) while optical transducer is selected to convert the recognition event into a measureable signal based on optical techniques (Choi, 2004).

Different types of uricase-based biosensor such as polyaniline biosensor, amperometric biosensor and optical biosensor are available for the determination of uric acid (Arslan, 2008; Erden & Kılıç, 2013; Kan *et al.*, 2004; Kuswandi *et al.*, 2008; Schrenkhammer & Wolfbeis, 2008). However, the operation and application of certain biosensors require long sample preparation time causing certain amounts of uric acid may also be oxidized, require laboratory environment for working, lack of stability, sensitivity and low reproducibility. Thus, demands for the current trend of biosensor development keep on increasing due to the advancement in technology.

The application of biosensors using optical detection has developed greatly as it performs remote, rapid and in-line determination of various analytes in a range of

application fields (Choi, 2004). It has indeed captured the attention of many scientists due to its greater sensitivity, higher efficiency and simpler to use.

In this study, uricase from *Arthrobacter globiformis* was integrated as a bio-receptor with an optical transducer for determination of uric acid. This is a preliminary study for future creation of a more sophisticated, versatile and sensitive enzyme-based optic fibre biosensor.

The objectives of this study include:

1. To access the effectiveness of uricase as the bio-receptor for uric acid.
2. To explore methods for optical sensing of uric acid using uricase as bio-receptor.
