(DR. NORIDA MAZLAN)

Supervisor,

Department of Agriculture Technology,

Faculty of Agriculture,

Universiti Putra Malaysia,

Serdang Selangor

Date: ..... 2013

## ACKNOWLEDGEMENT

First and foremost, I would like to express my deepest gratitude to Allah Almighty as with His blessing, for the eagerness, excitement, patience and strength to face all the obstacles in mission to accomplish my final year project paper, PRT 4999.

I would like to express my appreciation to my supervisor Dr. Norida Mazlan for her ideas and suggestions, guidance, continuous encouragement and constant support in making this final year project possible. In times when I met dead end in my project she always there to show me the way. She has always impressed me with her outstanding professional conduct and strong passion for education. I am grateful for her consistent support from the beginning of the project to the very end. I also would like to sincerely convey my appreciation for the time spent reading and correcting my many mistakes.

Sincere appreciations also to Mr. Thamsil, Mr. Jarkasi and Mr. Mohamed Zaki for helping me with my laboratory work and their advices. Thanks to MARDI staff Mr. Abu Zarim. I acknowledge my sincere indebtedness and gratitude to my parents Ismail bin Sulaiman and my adored mother Sarah bt Shamsudin for their understanding and financial support to finish this final year project. Millions of thanks to my fellow friends especially Nik Fakhrudin bin Nik Mood, Lily Amir bt Hazinan, Nur Hazwan bt Mohd Noor, Nur Asmah bt Ismail Bontak, Nor Shuhaidah bt Norizan, Nur Izyan bt Mohamed Zaki, Fharaazie Syahir bt Saedon, Nur Asyikin bt Mad Nawif for helping me in this project. As I have put all my effort on this project, I wish all the time spent for this project are worthy.

## **ABSTRACT**

Since 1941, the diamondback moth (DBM), *Plutellaxylostella* is one of the major pest of crucifers grown in the Cameron Highlands, Pahang. The larvae feed on leaves tissue, leaving the vein and cause economic losses to the cabbage farmers. Recurrent used of the same types of insecticide to control DBMs has led the insect to develop resistance. When resistance developed, the farmers will use higher dosage of insecticide and make frequent application which could causes detrimental effects to environment. The study was conducted to determine toxicity levels of selected insecticides on *Plutellaxylostella* from Cameron Highland. The leafdipp bioassay technique was used in this evaluation. Early third instar larvae were placed on insecticide treated cabbage leaf discs. Types of insecticide tested were Takumi® (Flubendiamide), Prevathon® (Chlorantraniliprole), Steward® (Indoxacarb) and no insecticide as control. 5 concentrations for each insecticide and 3replications were conducted to obtain LC<sub>50</sub> values by probit analysis. Parameter recorded was the rate of larval mortality. This study was arranged in Randomized Complete Block Design (RCBD). By comparing three types of insecticides, at 72 hours, Steward® has the highest toxicity level as having the lowest LC<sub>50</sub> value which is at 86.064ng/g in which needed only small amount a.i insecticides to kill 50% of its population. Meanwhile, Prevathon® and Takumi® have least toxicity at range 283.081ng/g and 2678.992ng/g respectively.

## **ABSTRAK**

Sejak tahun 1941 lagi, Kupu-kupu Intan (DBM), *Plutellaxylostella* (L) telah menjadi perosak utama tanaman kubis di Cameron Highlands, Pahang. Larvanya memakan tisu daun dan meninggalkan hanya urat daun sahaja ini menyebabkan masalah ekonomi kepada para petani kubis. Penggunaan racun yang sama secara berulang kali telah menyebabkan DBM menjadi semakin rintang kepada racun. Apabila tahap ketahanan semakin tinggi, petani akan menggunakan dos racun serangga yang lebih tinggi dan lebih kerap dan ini akan memberi kesan buruk kepada alam sekitar. Kajian telah dijalankan untuk menentukan tahap toksisitaracun serangga yang berbeza terhadap *P. xylostella* dari Cameron Highland. Teknik Celup Daun Bioassay digunakan untuk penilaian. Instar larva ketiga diletakkan pada daun kubis yang dirawat di dalam petri disk. Jenis-jenis racun serangga yang telah diuji iaitu Takumi® (Flubendiamide), Prevathon® (Chlorantraniliprole), Steward® (Indoxacarb) dan tiada racun serangga sebagai kawalan. 5 kepekatan untuk setiap racun serangga dan 3 replikasi telah dijalankan untuk mendapatkan nilai  $LC_{50}$  menggunakan probit analisis. Parameter yang akan direkod adalah kadar kematian larva. Kajian ini menggunakan Reka Bentuk Blok Rawak Lengkap (RCBD). Daripada perbandingan antara tiga jenis racun di dapati bahawa Steward mempunyai tahap ketoksikan tertinggi dimana nilai  $LC_{50}$  terendah pada 72 jam iaitu 86.064 ng/g ini telah menunjukkan bahawa hanya sedikit a.i racun serangga diperlukan untuk membunuh 50% daripada populasi. Diikuti dengan racun serangga Prevathon® dan Takumi® mempunyai ketoksikan yang kurang iaitu 283.081ng/g dan 2678.992ng/g.

## CHAPTER 1

### INTRODUCTION

#### 1.1 Background of Study

Cruciferous vegetables are economically important throughout the world. Cabbage (*Brassica oleracea*) is a member of the Brassicaceae (Mustard) family. This family includes broccoli, brussels sprouts, cauliflower, kale, mustard (greens), and collards. Local production is insufficient to meet domestic needs and Malaysia has to import cabbage worth RM60 million annually (Illias, 2007). Even though the cool climate of Cameron Highlands is conducive for growing cabbage, farmers have to apply generous amount of input such as fertilizer and pesticides in order to maintain crop quality.

Crucifer production has been seriously affected by a steady increase in insect pest, especially the diamondback moth. Chua and Ooi (1986) reported that in Malaysia, it is the principal pest of both upland (e.g. Cameron Highlands) and lowland vegetable-producing region. The diamondback moth (DBM), *Plutellaxylostella* L. (Lepidoptera: Yponomeutidae) is a major and cosmopolitan pest of cruciferous crops. This moth was introduced into Malaysia and probably it came into the country together with cruciferous plants, such as cabbage, “kailan” and mustard.

Due to the frequent outbreaks of this pest and the failure of the other control methods. Farmers in Cameron Highlands used insecticide on a regular basis. However, complete dependence on chemical control is the main reason for the build-up of resistance to a wide range of insecticides. Many farmers insist that this is the only way to achieve satisfactory control of the DBM. The insect is also turning out to be resistance to bioinsecticide such as, *Bacillus thurigiensis* (Mohan and Gujar, 2003). In normal condition, the insect takes about 32 days to develop from egg to adult while 21 to 51 days to complete a generation.

Generation is usually overlapped and all four life stages may be present in the field at the same time. This will lead to increasing number of the insect in one area. The DBM has proved increasingly difficult to control due largely to its marked ability for development of resistance to insecticides, most notably in Southeast Asia and the Far East (Talekar and Griggs, 1986; Tang *et al.*, 1988).The DBM has developed resistance to a large number of synthetic insecticides because of the continuous production of crucifers and the heavy use of insecticides.

Georghiou and Taylor (1976) reported that DBM was resistant to 36 insecticides in 14 tropical countries. According to (Shelton *et al.*, 1993), a synthetic pesticides used have adequately controlled of DBM population. However, experiment were conducted it showed when 41 populations from 19 states were tested for resistance to methomyl, permethrin and methamidophos (Shelton *et al.*, 1993) many populations shown resistance to one or more of the insecticide.

## 1.2 Problem statement and Study Objective

Uncontrolled use of pesticides applied by farmers has causes detrimental effects on the environments and could cause pesticide resistance on insect. When insect develop their resistance it will be more difficult to control. Therefore, the objective of this study is to determine toxicity levels of selected insecticides against on *Plutellaxylostella* from Cameron Highland, Pahang.
