**Faculty: Agriculture**

*Volvariella volvacea*, also known as straw mushroom is edible. It has attracted growing attention in Malaysia due to short cropping duration and provides distinct flavour and pleasant taste. However, this mushroom is highly perishable and has very short shelf life within 1-2 days under ambient temperature. The harvesting time and maturity of *V. volvacea* are important factors to maintain the quality of the mushroom. As the succeeding stages that follow the immature stage was particularly fast, farmers usually collected both immature and mature stage at harvest. Thus the objective of the first experiment was to evaluate the quality, antioxidant activity, and health risk assessment of *V. volvacea* at both stages. The mushrooms was cultivated on composted EFB and harvested after a week at immature (button stage) and mature (veil open stage). Button stage mushroom showed significantly higher firmness, and higher antioxidant activity with lower IC<sub>50</sub> of DPPH. In addition, button stage provides higher content of glutamic acid. However, both stages were within safety limit dietary intake from heavy metals. Thus, based on the results of the first experiment, button stage was further selected for the second experiment.

The objective of the second experiment was to determine the postharvest qualities and antioxidant activity at different storage temperatures (10, 15 °C, and room temperature (RT)) and storage durations (0, 2, 4, 6 and 8 days). The *V. volvacea* was cultivated according to Experiment 1 and the button stage were harvested for storage in perforated polyethylene (PE) plastic films. *Volvariella volvacea* stored at 15 °C showed significantly lowest in the percentage of weight loss, no veil opening, retains higher firmness, inhibits browning and PPO enzyme activity for about 6 days. The *V. volvacea* stored at 10 °C showed chilling injury symptoms and loss its postharvest quality. However, there was a sharp drop of DPPH activity when stored at RT. The

tissue ultrastructure of *V. volvacea* at 15 °C showed no major changes as compared to 10 °C and RT where there were tissue shrinkage and bacterial contamination. Thus the mushrooms were best stored at 15 °C for the next experiment.

The experiment was then expanded to the third objective which was to examine the optimum packaging systems (perforation, PVC film wrap, vacuum and control) applied to *V. volvacea* at different storage durations (0, 2, 4, 6 and 8 days) and stored at 15 °C. The cultivation and harvesting method was conducted as previous. The mushrooms were packed in 4 different packaging systems. PVC film was shown to maintain significantly higher firmness, lower weight loss, high DPPH radical scavenging activity, lower browning degree and PPO enzyme activity compared to other packaging. Furthermore, there was less damages and shrinkage of ultrastructure tissue when stored in PVC film packaging showed. Overall, button stage of *V. volvacea* were best stored at 15 °C storage temperature in PVC film packaging system which could retain their quality throughout 6 days storage periods and extend their shelf life.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia  
sebagai memenuhi keperluan untuk ijazah Master Sains

**PENILAIAN TERHADAP PERINGKAT KEMATANGAN, SUHU SIMPANAN  
DAN SISTEM PEMBUNGKUSAN LEPAS TUAI UNTUK PENGEKALAN  
KUALITI CENDAWAN JERAMI [*Volvariella volvacea* (Bul.) Singer]**

Oleh

**NUR SAKINAH BINTI MOHD JOHA**

Jun 2019

**Pengerusi: Azizah Misran, PhD**  
**Fakulti: Pertanian**

*Volvariella volvacea* adalah sejenis cendawan yang dikenali sebagai cendawan jerami dan boleh dimakan. Perhatian terhadap cendawan ini semakin berkembang di Malaysia disebabkan tempoh penanaman yang singkat dan cendawan ini memberikan rasa yang berbeza dan lazat. Walau bagaimanapun, cendawan ini sangat mudah rosak dan mempunyai jangka hayat yang sangat pendek di antara 1-2 hari pada suhu bilik. Tahap kematangan dan penuaian *V. volvacea* adalah satu parameter penting untuk menghasilkan cendawan yang berkualiti tinggi. Apabila proses kematangan berlaku dengan cepat, pengusaha biasanya mengutip cendawan jerami yang belum matang dan matang ketika proses penuaian. Oleh itu objektif eksperimen pertama adalah untuk menilai kualiti, aktiviti antioksidan, dan penilaian risiko kesihatan *V. volvacea* pada kedua-dua peringkat kematangan. Cendawan ini ditanam di atas kompos tandan buah kosong dan dituai selepas seminggu ketika belum matang (peringkat butang) dan matang (peringkat volva terbuka). Cendawan peringkat butang menunjukkan kekerasan, aktiviti antioksidan yang lebih tinggi, dengan  $IC_{50}$  DPPH yang rendah. Di samping itu, peringkat butang mempunyai kandungan asid glutamat yang lebih tinggi. Walaubagaimanapun, kedua-dua peringkat berada dalam had pengambilan makanan yang selamat dari logam berat. Oleh itu, berdasarkan hasil kajian eksperimen pertama, peringkat butang dipilih untuk menjalankan eksperimen kedua.

Objektif eksperimen kedua adalah bagi menentukan kualiti lepas tuai dan aktiviti antioksidan pada suhu penyimpanan yang berbeza (10, 15 °C, dan suhu bilik (RT)) dan tempoh penyimpanan (0, 2, 4, 6 dan 8 hari). *Volvariella Volvacea* ditanam seperti Eksperimen 1 dan peringkat butang dituai dan disimpan dalam plastik polietilena (PE) yang berlubang. *Volvariella volvacea* yang disimpan pada suhu 15 °C menunjukkan kehilangan berat paling rendah, tiada pembukaan volva, mengekalkan kekerasan yang lebih tinggi, menghalang kadar pemerangan dan enzim PPO. *Volvariella volvacea* yang

disimpan pada 10 °C menunjukkan gejala kecederaan dingin dan kehilangan kualiti lepas tuai. Walaubagaimanapun, terdapat penurunan mendadak aktiviti DPPH apabila disimpan pada suhu bilik. Tisu ultrastruktur *V. volvacea* pada 15 °C tidak menunjukkan perubahan besar berbanding 10 °C dan suhu bilik di mana terdapat pengecutan tisu dan pencemaran bakteria. Oleh itu, cendawan akan disimpan pada suhu 15 °C untuk eksperimen seterusnya.

Eksperimen seterusnya diperluaskan kepada objektif ketiga iaitu untuk menentukan sistem pembungkusan optimum (perforation, bungkus filem PVC, vakum dan kawalan) yang digunakan untuk *V. volvacea* pada tempoh penyimpanan yang berlainan (0, 2, 4, 6 dan 8 hari) dan disimpan pada suhu 15 °C. Kaedah penanaman dan penuaian telah dijalankan seperti sebelumnya. Cendawan telah dibungkus menggunakan 4 sistem pembungkusan yang berbeza. Filem PVC telah menunjukkan pengekalan kekerasan yang lebih tinggi, kehilangan berat yang lebih rendah, aktiviti pemerangkapan radikal DPPH yang tinggi, tahap pemerangan dan aktiviti enzim PPO yang rendah berbanding pembungkusan lain. Selain itu, terdapat kurang kerosakan dan pengecutan tisu ultrastruktur apabila disimpan dalam pembungkusan filem PVC. Secara keseluruhan, peringkat butang *V. volvacea* merupakan tahap paling sesuai dituai dan disimpan pada suhu 15 °C menggunakan sistem pembungkusan filem PVC bagi mengekalkan kualiti sepanjang tempoh penyimpanan dan seterusnya melanjutkan jangka hayat cendawan tersebut sehingga hari keenam.

## ACKNOWLEDGEMENTS

I would like to express my sincere gratitude towards my supervisors Dr. Azizah Misran and Prof. Dr. Mahmud Tengku Muda Mohamed for their enthusiastic guidance, continuous support and enhancement in accomplishing my research journey and thesis. Also, thank you for the effective discussions, knowledge sharing, and ideas for this research. I am also grateful to be part of research team with Dr. Sumaiyah Abdullah, Dr. Azhar Mohamad and Fatin Nabilah Fisol which are committed, supportive and encourage in this mushroom research.

To my lovely and wonderful family, I greatly appreciated of your understanding, unconditional support, motivational spirit, concern and sacrifices to me along my study journey. They have been so supportive from the start of this Master study journey.

I would like to thank Ministry of Education that providing Fundamental Research Grant Scheme and MyBrain15 scholarship in accomplishing this project. I would also like to thank to UPM for providing Graduate Research Fellowship (GRF) and other facilities to conduct this study. Special thanks to my lovely friends, postgraduate members, and UPM staffs for their unconditional support, kind help, advices and comments.

Sakinah Joha

This thesis was submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfillment of the requirement for the degree Master of Science. The members of Supervisory Committee were as follows:

**Azizah binti Misran, PhD**

Senior Lecturer  
Faculty of Agriculture  
Universiti Putra Malaysia  
(Chairperson)

**Mahmud bin Tengku Muda Mohamed, PhD**

Professor  
Faculty of Agriculture  
Universiti Putra Malaysia

## CHAPTER 1

### GENERAL INTRODUCTION

Edible mushroom contributes to large income and became economically important industrial commodities (Kukura *et al.*, 1998). These include production for whole food, fermented beverages, food additives, antibiotics, probiotics, pharmaceutical industries, biofuels, enzymes, and some bioactive compounds such as vitamins, fatty acids and sterols (Gan *et al.*, 2013; Manzi *et al.*, 1999). Mushroom is widely cultivated all over the world (Kumar *et al.*, 2013). According to FAOSTAT, world mushroom production was highest in China about 7.8 million tonnes in 2016. Mushroom industry in Malaysia is still low and it commercializes at a small scale. In 2014 and current, oyster mushroom (*Pleurotus* spp.) is mainly cultivated, accounts for 90.89% compared to other edible mushrooms produced in the world (Amin *et al.*, 2014; Haimid *et al.*, 2013; Rosmiza *et al.*, 2016).

*Volvariella volvacea* is an edible mushroom derived from Plutacea family which also known as paddy straw mushroom, chinese mushroom and warm mushroom (Chang, 1977). *Volvariella volvacea* are top five most commercialized mushrooms in the world (Chang, 1977; Ahlawat *et al.*, 2010; Roy *et al.*, 2014). However in Malaysia, *V. volvacea* is not widely cultivated and it accounts for only 0.47% of mushroom production (Rosmiza *et al.*, 2016). *Volvariella volvacea* were grown at high temperature in tropics and subtropics climate which is in the range of 30-35 °C (Chang, 1977; Thakur and Singh, 2014). *Volvariella volvacea* became popular because it provides distinct flavor and taste where it also has shorter cropping duration (Rajapakse, 2011 and Jamjumroon *et al.*, 2012). Besides that, *V. volvacea* is a good source of vitamin, bioactive compound, proteins, and amino acids until it is known as therapeutic food (Alam *et al.*, 2011; Rajapakse, 2011; Guo *et al.*, 2012; Sithole *et al.*, 2017). Therefore, this mushroom has a very high potential for commercialization purposes as great food source to the consumers.

The commercial potential of *V. volvacea* is restricted to their very short shelf life, which is 1-2 days under ambient temperature. Thus, most of the time, this mushroom was sold directly after harvest or being processed for canning (Rai and Arumuganathan 2008). According to Ye *et al.* (2012), faster senescence of mushroom lessens the commercial value of harvested mushroom. *Volvariella volvacea* mushroom usually consumed within 6-8 hours to prevent the veil opening, maintain its freshness, quality, and texture (Thiribhuvanamala *et al.*, 2012). The high respiration rate and lacking of physical protection in avoiding water loss becomes the primary factors that are often associated with quality deterioration. Therefore, postharvest study is very important in preserving and maintaining the harvested mushroom (Dhalsamant *et al.*, 2015; Jamjumroon *et al.*, 2012; Jaworska *et al.*, 2011). Retaining quality of mushroom at first place would benefit either mushroom industry or consumers.

The time of maturity and the harvesting of *V. volvacea* remains one of the important factors enhancing the postharvest life of the mushroom. Harvest decision is done traditionally by farmer through observation and experience overlooking the nutritional quality of *V. volvacea*. Different maturity stages of mushroom may contribute to different advantage and contents. Mature stage (veil open) mushroom stays longer and absorbed more minerals from cultivation media compared to immature stage. Since mushroom absorbs nutrient from surrounding, it has become an indicator to determine heavy metal pollution (Kotwaliwale *et al.*, 2007; Peng and Wang, 2013; Rajapakse, 2011; Tuzen, 2003). Assessment of safety limit intake through estimated daily intake (EDI) and target hazard quotient (THQ) could disclose the toxicity level of mushroom towards consumers (Ihugba *et al.*, 2018; Huang *et al.*, 2015). Cultivation medium of mushroom should be within safe limit intake through health risk assessment.

Other postharvest problems of this mushroom include browning, chilling injuries and weight loss (Rai and Arumuganathan 2008; Jamjumroon *et al.*, 2012). This was due to high metabolic and respiration rate occur in mushroom. Despite that chilling injuries problem, mushrooms also deteriorated, increased its respiration rate when subjected to higher temperature which mainly due to elevation of microbial contamination and physiological activity (Valerie and David, 2008). The surrounding temperature greatly affects the metabolic activity of mushroom after harvest. According to Singh *et al.* (2010), external factor like temperature is one of the main key contributors affecting the respiration. These problems commonly can be controlled by applying suitable storage temperature along its storage duration and thus reducing the deterioration rate and postharvest loss.

Postharvest treatment and technology like packaging plays a critical role in the controlling senescence rate in mushroom by acting as important physical barrier at first line protection that powerfully controls its surrounding moisture, respiration, and metabolic activity that lead to mushroom's quality. According to Ye *et al.* (2012), packaging system under passive modified atmosphere packaging (MAP) developed gaseous components naturally resulted from the respiration and packaging permeability. MAP with proper technique was established to be a successful tool in extending mushroom shelf life (Kim *et al.*, 2006; Valerie and David, 2008). Common packaging systems implemented for mushrooms including vacuum packaging (Burg and Burg 1966; Tsang 1999), perforated packaging (Dhalsamant *et al.*, 2015), and film wrap (Li *et al.*, 2017). Previous study implemented the microperforated type, vacuum packaging using glass jar, by sampling the mushroom without independent cultivation which could retain its shelf life 2-6 days. Current study improved by monitor its cultivation technique and using macroperforated, vacuum using plastic material. The packaging system contributed to the longer shelf life of mushroom during storage.

High perishability after harvest and time consuming during transport chain to market became a major bottleneck in the mushroom production. Storage temperature and packaging system have been demonstrated to give a greater impact in slowing down the deterioration rate, retaining physical qualities and extending shelf life of mushrooms. Therefore, the study has been conducted to improve and maintain the quality of mushroom throughout storage durations.

Proper postharvest treatment might extend the shelf life, slow down deterioration, retain physical quality and eventually reduce the postharvest losses. Therefore, the objectives of this study are

- (i) to evaluate the quality, antioxidant activity, and safety limit intake of *V. volvacea* at button and veil opening stages,
- (ii) to determine the postharvest qualities and antioxidant activity at different storage temperatures and durations, and
- (iii) to examine the optimum packaging systems applied to *V. volvacea* at different storage durations.

## BIODATA OF STUDENT

The student, Nur Sakinah Mohd Joha, daughter to Mohd Joha Che Lop and Juriyah Ismail, was born on 2<sup>nd</sup> November 1992. She obtained her Malaysian Education Certificate at SMK Sultan Idris Shah II, Gerik, Perak, in 2009. She managed to complete pre university study in Perak Matriculation College in 2010. In 2015, she graduated with a degree in Bachelor of Science (Hons) Major (Biology) from Universiti Putra Malaysia.

## LIST OF PUBLICATIONS

**Nur Sakinah, M. J.**, Misran, A., Mahmud, T. M. M., Abdullah, S., and Fatin Nabilah, F. (2017). Texture and Ultrastructure of Straw Mushroom (*Volvariella Volvacea*) at Different Maturity Stages Grown on EFB Compost. Oral presentation, *ISSAAS 2017 International Congress and General Meeting. "Green Agriculture in Southeast Asia: Theories and Practices"*, 14<sup>th</sup> – 16<sup>th</sup> October, Vietnam National University of Agriculture, Hanoi, Vietnam.

Fatin Nabilah Fisol, Sumaiyah Abdullah, Mahmud T.M. Mohamed, Azizah Misran, **Nur Sakinah Mohd Joha**, Azhar Mohamad, and Mohamad Yuzaidi Azmi. (2017). Effects of different empty fruit bunch (EFB) composting periods on the production of *Volvariella volvacea*. Oral presentation, *ISSAAS 2017 International Congress and General Meeting. "Green Agriculture in Southeast Asia: Theories and Practices"*, 14<sup>th</sup> – 16<sup>th</sup> October, Vietnam National University of Agriculture, Hanoi, Vietnam.

**Nur Sakinah Mohd Joha**, Azizah Misran, Mahmud Tengku Muda Mohamed dan Sumaiyah Abdullah. (2018). Kesan pengaruh suhu dan tempoh simpanan terhadap kualiti fizikal pasca tuai *Volvariella Volvacea*. Poster presentation, *Seminar Industri Cendawan: Ladang ke kilang*, 24<sup>th</sup> Mac, Malaysian Nuclear Agency, Bangi, Malaysia.

**Nur Sakinah Mohd Joha**, Azizah Misran, Mahmud Tengku Muda Mohamed, Sumaiyah Abdullah and Azhar Mohamad. (2018). Maturity stages, effect of storage temperatures and durations on physical quality and ultrastructure of postharvest shelf life of straw mushroom (*Volvariella volvacea*). Poster presentation, *27<sup>th</sup> Scientific Conference of The Microscopy Society Malaysia (27<sup>th</sup> SCMSM 2018)*, Melaka.
